

A space shuttle is carried out into space by powerful rockets. They are accelerating, increasing in speed rapidly. To do so, a force must be exerted on them according to Newton's second law, $\Sigma \overrightarrow{\mathbf{F}}=m \overrightarrow{\mathbf{a}}$. What exerts this force? The rocket engines exert a force on the gases they push out (expel) from the rear of the rockets (labeled $\overrightarrow{\mathbf{F}}_{\mathrm{GR}}$ ).
According to Newton's third law, these ejected gases exert an equal and opposite force on the rockets in the forward direction. It is this "reaction" force exerted on the rockets by the gases, labeled $\overrightarrow{\mathbf{F}}_{\text {RG }}$, that accelerates the rockets forward.

## Dynamics: Newton's Laws of Motion

## CHAPTER-OPENING QUESTIONS—Guess now!

1. A $150-\mathrm{kg}$ football player collides head-on with a $75-\mathrm{kg}$ running back. During the collision, the heavier player exerts a force of magnitude $F_{\mathrm{A}}$ on the smaller player. If the smaller player exerts a force $F_{\mathrm{B}}$ back on the heavier player, which response is most accurate?
(a) $F_{\mathrm{B}}=F_{\mathrm{A}}$.
(b) $F_{\mathrm{B}}<F_{\mathrm{A}}$.
(c) $F_{\mathrm{B}}>F_{\mathrm{A}}$.
(d) $F_{\mathrm{B}}=0$.
(e) We need more information.
2. A line by the poet T. S. Eliot (from Murder in the Cathedral) has the women of Canterbury say "the earth presses up against our feet." What force is this?
(a) Gravity.
(b) The normal force.
(c) A friction force.
(d) Centrifugal force.
(e) No force-they are being poetic.

We have discussed how motion is described in terms of velocity and acceleration. Now we deal with the question of why objects move as they do: What makes an object at rest begin to move? What causes an object to accelerate or decelerate? What is involved when an object moves in a curved path? We can answer in each case that a force is required. In this Chapter ${ }^{\dagger}$, we will investigate the connection between force and motion, which is the subject called dynamics.

## 4-1 Force

Intuitively, we experience force as any kind of a push or a pull on an object. When you push a stalled car or a grocery cart (Fig. 4-1), you are exerting a force on it. When a motor lifts an elevator, or a hammer hits a nail, or the wind blows the leaves of a tree, a force is being exerted. We often call these contact forces because the force is exerted when one object comes in contact with another object. On the other hand, we say that an object falls because of the force of gravity (which is not a contact force).

If an object is at rest, to start it moving requires force-that is, a force is needed to accelerate an object from zero velocity to a nonzero velocity. For an object already moving, if you want to change its velocity—either in direction or in magnitude-a force is required. In other words, to accelerate an object, a force is always required. In Section 4-4 we discuss the precise relation between acceleration and net force, which is Newton's second law.

One way to measure the magnitude (or strength) of a force is to use a spring scale (Fig. 4-2). Normally, such a spring scale is used to find the weight of an object; by weight we mean the force of gravity acting on the object (Section 4-6). The spring scale, once calibrated, can be used to measure other kinds of forces as well, such as the pulling force shown in Fig. 4-2.

A force exerted in a different direction has a different effect. Force has direction as well as magnitude, and is indeed a vector that follows the rules of vector addition discussed in Chapter 3. We can represent any force on a diagram by an arrow, just as we did with velocity. The direction of the arrow is the direction of the push or pull, and its length is drawn proportional to the magnitude of the force.

FIGURE 4-2 A spring scale used to measure a force.

## 4-2 Newton's First Law of Motion

What is the relationship between force and motion? Aristotle (384-322 B.C.) believed that a force was required to keep an object moving along a horizontal plane. To Aristotle, the natural state of an object was at rest, and a force was believed necessary to keep an object in motion. Furthermore, Aristotle argued, the greater the force on the object, the greater its speed.

Some 2000 years later, Galileo disagreed: he maintained that it is just as natural for an object to be in motion with a constant velocity as it is for it to be at rest.

[^0]To understand Galileo's idea, consider the following observations involving motion along a horizontal plane. To push an object with a rough surface along a tabletop at constant speed requires a certain amount of force. To push an equally heavy object with a very smooth surface across the table at the same speed will require less force. If a layer of oil or other lubricant is placed between the surface of the object and the table, then almost no force is required to keep the object moving. Notice that in each successive step, less force is required. As the next step, we imagine there is no friction at all, that the object does not rub against the table-or there is a perfect lubricant between the object and the table-and theorize that once started, the object would move across the table at constant speed with no force applied. A steel ball bearing rolling on a hard horizontal surface approaches this situation. So does a puck on an air table, in which a thin layer of air reduces friction almost to zero.

It was Galileo's genius to imagine such an idealized world-in this case, one where there is no friction-and to see that it could lead to a more accurate and richer understanding of the real world. This idealization led him to his remarkable conclusion that if no force is applied to a moving object, it will continue to move with constant speed in a straight line. An object slows down only if a force is exerted on it. Galileo thus interpreted friction as a force akin to ordinary pushes and pulls.

To push an object across a table at constant speed requires a force from your hand that can balance the force of friction (Fig. 4-3). When the object moves at constant speed, your pushing force is equal in magnitude to the friction force; but these two forces are in opposite directions, so the net force on the object (the vector sum of the two forces) is zero. This is consistent with Galileo's viewpoint, for the object moves with constant velocity when no net force is exerted on it.

Upon this foundation laid by Galileo, Isaac Newton (Fig. 4-4) built his great theory of motion. Newton's analysis of motion is summarized in his famous "three laws of motion." In his great work, the Principia (published in 1687), Newton readily acknowledged his debt to Galileo. In fact, Newton's first law of motion is close to Galileo's conclusions. It states that

Every object continues in its state of rest, or of uniform velocity in a straight
line, as long as no net force acts on it.
The tendency of an object to maintain its state of rest or of uniform velocity in a straight line is called inertia. As a result, Newton's first law is often called the law of inertia.

CONCEPTUAL EXAMPLE 4-1 Newton's first law. A school bus comes to a sudden stop, and all of the backpacks on the floor start to slide forward. What force causes them to do that?

RESPONSE It isn't "force" that does it. By Newton's first law, the backpacks continue their state of motion, maintaining their velocity. The backpacks slow down if a force is applied, such as friction with the floor.

## Inertial Reference Frames

Newton's first law does not hold in every reference frame. For example, if your reference frame is an accelerating car, an object such as a cup resting on the dashboard may begin to move toward you (it stayed at rest as long as the car's velocity remained constant). The cup accelerated toward you, but neither you nor anything else exerted a force on it in that direction. Similarly, in the reference frame of the decelerating bus in Example 4-1, there was no force pushing the backpacks forward. In accelerating reference frames, Newton's first law does not hold. Physics is easier in reference frames in which Newton's first law does hold, and they are called inertial reference frames (the law of inertia is valid in them). For most purposes, we usually make the approximation that a reference frame fixed on the Earth is an inertial frame. This is not precisely true, due to the Earth's rotation, but usually it is close enough.

FIGURE 4-3 $\overrightarrow{\mathbf{F}}$ represents the force applied by the person and $\overrightarrow{\mathbf{F}}_{\text {fr }}$ represents the force of friction.

NEWTON'S FIRST LAW OF MOTION

FIGURE 4-4
Isaac Newton (1642-1727). Besides developing mechanics, including his three great laws of motion and the law of universal gravitation, he also tried to understand the nature of light.

## CAUTION

Distinguish mass from weight

FIGURE 4-5 The bobsled accelerates because the team exerts a force.

Any reference frame that moves with constant velocity (say, a car or an airplane) relative to an inertial frame is also an inertial reference frame. Reference frames where the law of inertia does not hold, such as the accelerating reference frames discussed above, are called noninertial reference frames. How can we be sure a reference frame is inertial or not? By checking to see if Newton's first law holds. Thus Newton's first law serves as the definition of inertial reference frames.

## 4-3 Mass

Newton's second law, which we come to in the next Section, makes use of the concept of mass. Newton used the term mass as a synonym for "quantity of matter." This intuitive notion of the mass of an object is not very precise because the concept "quantity of matter" is not very well defined. More precisely, we can say that mass is a measure of the inertia of an object. The more mass an object has, the greater the force needed to give it a particular acceleration. It is harder to start it moving from rest, or to stop it when it is moving, or to change its velocity sideways out of a straight-line path. A truck has much more inertia than a baseball moving at the same speed, and a much greater force is needed to change the truck's velocity at the same rate as the ball's. The truck therefore has much more mass.

To quantify the concept of mass, we must define a standard. In SI units, the unit of mass is the kilogram (kg) as we discussed in Chapter 1, Section 1-5.

The terms mass and weight are often confused with one another, but it is important to distinguish between them. Mass is a property of an object itself (a measure of an object's inertia, or its "quantity of matter"). Weight, on the other hand, is a force, the pull of gravity acting on an object. To see the difference, suppose we take an object to the Moon. The object will weigh only about one-sixth as much as it did on Earth, since the force of gravity is weaker. But its mass will be the same. It will have the same amount of matter as on Earth, and will have just as much inertia-in the absence of friction, it will be just as hard to start it moving on the Moon as on Earth, or to stop it once it is moving. (More on weight in Section 4-6.)

## 4-4 Newton's Second Law of Motion

Newton's first law states that if no net force is acting on an object at rest, the object remains at rest; or if the object is moving, it continues moving with constant speed in a straight line. But what happens if a net force is exerted on an object? Newton perceived that the object's velocity will change (Fig. 4-5). A net force exerted on an object may make its velocity increase. Or, if the net force is in a direction opposite to the motion, that force will reduce the object's velocity. If the net force acts sideways on a moving object, the direction of the object's velocity changes. That change in the direction of the velocity is also an acceleration. So a sideways net force on an object also causes acceleration. In general, we can say that a net force causes acceleration.

What precisely is the relationship between acceleration and force? Everyday experience can suggest an answer. Consider the force required to push a cart when friction is small enough to ignore. (If there is friction, consider the net force, which is the force you exert minus the force of friction.) If you push the cart horizontally with a gentle but constant force for a certain period of time, you will make the cart accelerate from rest up to some speed, say $3 \mathrm{~km} / \mathrm{h}$. If you push with twice the force, the cart will reach $3 \mathrm{~km} / \mathrm{h}$ in half the time. The acceleration will be twice as great. If you triple the force, the acceleration is tripled, and so on. Thus, the acceleration of an object is directly proportional ${ }^{\dagger}$ to the net applied force. But the acceleration depends on the mass of the object as well. If you push an empty grocery cart with the same force as you push one that is filled with groceries, you will find that the full cart accelerates more slowly.

[^1]The greater the mass, the less the acceleration for the same net force. The mathematical relation, as Newton argued, is that the acceleration of an object is inversely proportional to its mass. These relationships are found to hold in general and can be summarized as follows:

The acceleration of an object is directly proportional to the net force acting on it, and is inversely proportional to the object's mass. The direction of the acceleration is in the direction of the net force acting on the object.
This is Newton's second law of motion.
Newton's second law can be written as an equation:

$$
\overrightarrow{\mathbf{a}}=\frac{\sum \overrightarrow{\mathbf{F}}}{m},
$$

where $\overrightarrow{\mathbf{a}}$ stands for acceleration, $m$ for the mass, and $\Sigma \overrightarrow{\mathbf{F}}$ for the net force on the object. The symbol $\Sigma$ (Greek "sigma") stands for "sum of"; $\overrightarrow{\mathbf{F}}$ stands for force, so $\Sigma \overrightarrow{\mathbf{F}}$ means the vector sum of all forces acting on the object, which we define as the net force.

We rearrange this equation to obtain the familiar statement of Newton's second law:

$$
\begin{equation*}
\Sigma \overrightarrow{\mathbf{F}}=m \overrightarrow{\mathbf{a}} \tag{4-1}
\end{equation*}
$$

Newton's second law relates the description of motion to the cause of motion, force. It is one of the most fundamental relationships in physics. From Newton's second law we can make a more precise definition of force as an action capable of accelerating an object.

Every force $\overrightarrow{\mathbf{F}}$ is a vector, with magnitude and direction. Equation 4-1 is a vector equation valid in any inertial reference frame. It can be written in component form in rectangular coordinates as

$$
\Sigma F_{x}=m a_{x}, \quad \Sigma F_{y}=m a_{y}, \quad \Sigma F_{z}=m a_{z} .
$$

If the motion is all along a line (one-dimensional), we can leave out the subscripts and simply write $\Sigma F=m a$. Again, $a$ is the acceleration of an object of mass $m$, and $\Sigma F$ includes all the forces acting on that object, and only forces acting on that object. (Sometimes the net force $\Sigma F$ is written as $F_{\text {net }}$, so $F_{\text {net }}=m a$.)

In SI units, with the mass in kilograms, the unit of force is called the newton (N). One newton is the force required to impart an acceleration of $1 \mathrm{~m} / \mathrm{s}^{2}$ to a mass of 1 kg . Thus $1 \mathrm{~N}=1 \mathrm{~kg} \cdot \mathrm{~m} / \mathrm{s}^{2}$.

In cgs units, the unit of mass is the gram $^{\dagger}(\mathrm{g})$. The unit of force is the dyne, which is defined as the net force needed to impart an acceleration of $1 \mathrm{~cm} / \mathrm{s}^{2}$ to a mass of 1 g . Thus 1 dyne $=1 \mathrm{~g} \cdot \mathrm{~cm} / \mathrm{s}^{2}$. Because $1 \mathrm{~g}=10^{-3} \mathrm{~kg}$ and $1 \mathrm{~cm}=10^{-2} \mathrm{~m}$, then 1 dyne $=10^{-5} \mathrm{~N}$.

In the British system, which we rarely use, the unit of force is the pound (abbreviated lb ), where $1 \mathrm{lb}=4.44822 \mathrm{~N} \approx 4.45 \mathrm{~N}$. The unit of mass is the slug, which is defined as that mass which will undergo an acceleration of $1 \mathrm{ft} / \mathrm{s}^{2}$ when a force of 1 lb is applied to it . Thus $1 \mathrm{lb}=1 \mathrm{slug} \cdot \mathrm{ft} / \mathrm{s}^{2}$. Table $4-1$ summarizes the units in the different systems.

It is very important that only one set of units be used in a given calculation or Problem, with the SI being what we almost always use. If the force is given in, say, newtons, and the mass in grams, then before attempting to solve for the acceleration in SI units, we must change the mass to kilograms. For example, if the force is given as 2.0 N along the $x$ axis and the mass is 500 g , we change the latter to 0.50 kg , and the acceleration will then automatically come out in $\mathrm{m} / \mathrm{s}^{2}$ when Newton's second law is used:

$$
a_{x}=\frac{\Sigma F_{x}}{m}=\frac{2.0 \mathrm{~N}}{0.50 \mathrm{~kg}}=\frac{2.0 \mathrm{~kg} \cdot \mathrm{~m} / \mathrm{s}^{2}}{0.50 \mathrm{~kg}}=4.0 \mathrm{~m} / \mathrm{s}^{2},
$$

where we set $1 \mathrm{~N}=1 \mathrm{~kg} \cdot \mathrm{~m} / \mathrm{s}^{2}$.

[^2]NEWTON'S SECOND LAW OF MOTION

NEWTON'S SECOND LAW OF MOTION

TABLE 4-1
Units for Mass and Force

| System | Mass | Force |
| :--- | :---: | :---: |
| SI | kilogram <br> $(\mathrm{kg})$ | newton $(\mathrm{N})$ <br> $\left(=\mathrm{kg} \cdot \mathrm{m} / \mathrm{s}^{2}\right)$ |
| cgs | gram $(\mathrm{g})$ | dyne <br> $\left(=\mathrm{g} \cdot \mathrm{cm} / \mathrm{s}^{2}\right)$ |
| British | slug | pound $(\mathrm{lb})$ |

Conversion factors: 1 dyne $=10^{-5} \mathrm{~N}$;
$1 \mathrm{lb} \approx 4.45 \mathrm{~N}$;
1 slug $\approx 14.6 \mathrm{~kg}$.

PROBLEM SOLVING Use a consistent set of units

EXAMPLE 4-2 ESTIMATE Force to accelerate a fast car. Estimate the net force needed to accelerate (a) a $1000-\mathrm{kg}$ car at $\frac{1}{2} g$; (b) a 200 -gram apple at the same rate.
APPROACH We use Newton's second law to find the net force needed for each object; we are given the mass and the acceleration. This is an estimate (the $\frac{1}{2}$ is not said to be precise) so we round off to one significant figure.
SOLUTION (a) The car's acceleration is $a=\frac{1}{2} g=\frac{1}{2}\left(9.8 \mathrm{~m} / \mathrm{s}^{2}\right) \approx 5 \mathrm{~m} / \mathrm{s}^{2}$. We use Newton's second law to get the net force needed to achieve this acceleration:

$$
\Sigma F=m a \approx(1000 \mathrm{~kg})\left(5 \mathrm{~m} / \mathrm{s}^{2}\right)=5000 \mathrm{~N} .
$$

(If you are used to British units, to get an idea of what a $5000-\mathrm{N}$ force is, you can divide by $4.45 \mathrm{~N} / \mathrm{lb}$ and get a force of about 1000 lb .)
(b) For the apple, $m=200 \mathrm{~g}=0.2 \mathrm{~kg}$, so

$$
\Sigma F=m a \approx(0.2 \mathrm{~kg})\left(5 \mathrm{~m} / \mathrm{s}^{2}\right)=1 \mathrm{~N} .
$$

EXAMPLE 4-3 Force to stop a car. What average net force is required to bring a $1500-\mathrm{kg}$ car to rest from a speed of $100 \mathrm{~km} / \mathrm{h}$ within a distance of 55 m ? APPROACH We use Newton's second law, $\Sigma F=m a$, to determine the force, but first we need to calculate the acceleration $a$. We assume the acceleration is constant so that we can use the kinematic equations, Eqs. 2-11, to calculate it.

FIGURE 4-6
Example 4-3.

SOLUTION We assume the motion is along the $+x$ axis (Fig. 4-6). We are given the initial velocity $v_{0}=100 \mathrm{~km} / \mathrm{h}=27.8 \mathrm{~m} / \mathrm{s}$ (Section 1-6), the final velocity $v=0$, and the distance traveled $x-x_{0}=55 \mathrm{~m}$. From Eq. 2-11c, we have
so

$$
v^{2}=v_{0}^{2}+2 a\left(x-x_{0}\right),
$$

$$
a=\frac{v^{2}-v_{0}^{2}}{2\left(x-x_{0}\right)}=\frac{0-(27.8 \mathrm{~m} / \mathrm{s})^{2}}{2(55 \mathrm{~m})}=-7.0 \mathrm{~m} / \mathrm{s}^{2}
$$

The net force required is then

$$
\Sigma F=m a=(1500 \mathrm{~kg})\left(-7.0 \mathrm{~m} / \mathrm{s}^{2}\right)=-1.1 \times 10^{4} \mathrm{~N},
$$

or $11,000 \mathrm{~N}$. The force must be exerted in the direction opposite to the initial velocity, which is what the negative sign means.
NOTE If the acceleration is not precisely constant, then we are determining an "average" acceleration and we obtain an "average" net force.

Newton's second law, like the first law, is valid only in inertial reference frames (Section 4-2). In the noninertial reference frame of a car that begins accelerating, a cup on the dashboard starts sliding-it accelerates-even though the net force on it is zero. Thus $\Sigma \overrightarrow{\mathbf{F}}=m \overrightarrow{\mathbf{a}}$ does not work in such an accelerating reference frame ( $\Sigma \overrightarrow{\mathbf{F}}=0$, but $\overrightarrow{\mathbf{a}} \neq 0$ in this noninertial frame).

EXERCISE A Suppose you watch a cup slide on the (smooth) dashboard of an accelerating car as we just discussed, but this time from an inertial reference frame outside the car, on the street. From your inertial frame, Newton's laws are valid. What force pushes the cup off the dashboard?

## 4-5 Newton's Third Law of Motion

Newton's second law of motion describes quantitatively how forces affect motion. But where, we may ask, do forces come from? Observations suggest that a force exerted on any object is always exerted by another object. A horse pulls a wagon, a person pushes a grocery cart, a hammer pushes on a nail, a magnet attracts a paper clip. In each of these examples, a force is exerted on one object, and that force is exerted by another object. For example, the force exerted on the nail is exerted by the hammer.

But Newton realized that things are not so one-sided. True, the hammer exerts a force on the nail (Fig. 4-7). But the nail evidently exerts a force back on the hammer as well, for the hammer's speed is rapidly reduced to zero upon contact. Only a strong force could cause such a rapid deceleration of the hammer. Thus, said Newton, the two objects must be treated on an equal basis. The hammer exerts a force on the nail, and the nail exerts a force back on the hammer. This is the essence of Newton's third law of motion:

## Whenever one object exerts a force on a second object, the second object exerts an equal force in the opposite direction on the first.

This law is sometimes paraphrased as "to every action there is an equal and opposite reaction." This is perfectly valid. But to avoid confusion, it is very important to remember that the "action" force and the "reaction" force are acting on different objects.

As evidence for the validity of Newton's third law, look at your hand when you push against the edge of a desk, Fig. 4-8. Your hand's shape is distorted, clear evidence that a force is being exerted on it. You can see the edge of the desk pressing into your hand. You can even feel the desk exerting a force on your hand; it hurts! The harder you push against the desk, the harder the desk pushes back on your hand. (You only feel forces exerted on you; when you exert a force on another object, what you feel is that object pushing back on you.)

FIGURE 4-8 If your hand pushes against the edge of a desk (the force vector is shown in red), the desk pushes back against your hand (this force vector is shown in a different color, violet, to remind us that this force acts on a different object).

The force the desk exerts on your hand has the same magnitude as the force your hand exerts on the desk. This is true not only if the desk is at rest but is true even if the desk is accelerating due to the force your hand exerts.

As another demonstration of Newton's third law, consider the ice skater in Fig. 4-9. There is very little friction between her skates and the ice, so she will move freely if a force is exerted on her. She pushes against the wall; and then she starts moving backward. The force she exerts on the wall cannot make her start moving, because that force acts on the wall. Something had to exert a force on her to start her moving, and that force could only have been exerted by the wall. The force with which the wall pushes on her is, by Newton's third law, equal and opposite to the force she exerts on the wall.

When a person throws a package out of a small boat (initially at rest), the boat starts moving in the opposite direction. The person exerts a force on the package. The package exerts an equal and opposite force back on the person, and this force propels the person (and the boat) backward slightly.

FIGURE 4-7 A hammer striking a nail. The hammer exerts a force on the nail and the nail exerts a force back on the hammer. The latter force decelerates the hammer and brings it to rest.

```
NEWTON'S THIRD LAW
OF MOTION
```

CAUTION

Action and reaction forces act on different objects

FIGURE 4-9 An example of Newton's third law: when an ice skater pushes against the wall, the wall pushes back and this force causes her to accelerate away.

FIGURE 4-10 Another example of Newton's third law: the launch of a rocket. The rocket engine pushes the gases downward, and the gases exert an equal and opposite force upward on the rocket, accelerating it upward. (A rocket does not accelerate as a result of its expelled gases pushing against the ground.)

FIGURE 4-11 We can walk forward because, when one foot pushes backward against the ground, the ground pushes forward on that foot (Newton's third law). The two forces shown act on different objects.

| NEWTON'S THIRD LAW |
| ---: |
| OF MOTION |

Rocket propulsion also is explained using Newton's third law (Fig. 4-10). A common misconception is that rockets accelerate because the gases rushing out the back of the engine push against the ground or the atmosphere. Not true. What happens, instead, is that a rocket exerts a strong force on the gases, expelling them; and the gases exert an equal and opposite force on the rocket. It is this latter force that propels the rocket forward-the force exerted on the rocket by the gases (see Chapter-Opening Photo, page 75). Thus, a space vehicle is maneuvered in empty space by firing its rockets in the direction opposite to that in which it needs to accelerate. When the rocket pushes on the gases in one direction, the gases push back on the rocket in the opposite direction. Jet aircraft too accelerate because the gases they thrust out backwards exert a forward force on the engines (Newton's third law).

Consider how we walk. A person begins walking by pushing with the foot backward against the ground. The ground then exerts an equal and opposite force forward on the person (Fig. 4-11), and it is this force, on the person, that moves the person forward. (If you doubt this, try walking normally where there is no friction, such as on very smooth slippery ice.) In a similar way, a bird flies forward by exerting a backward force on the air, but it is the air pushing forward (Newton's third law) on the bird's wings that propels the bird forward.

## CONCEPTUAL EXAIMPLE 4-4 What exerts the force to move a car?

What makes a car go forward?
RESPONSE A common answer is that the engine makes the car move forward. But it is not so simple. The engine makes the wheels go around. But if the tires are on slick ice or wet mud, they just spin. Friction is needed. On firm ground, the tires push backward against the ground because of friction. By Newton's third law, the ground pushes on the tires in the opposite direction, accelerating the car forward.

We tend to associate forces with active objects such as humans, animals, engines, or a moving object like a hammer. It is often difficult to see how an inanimate object at rest, such as a wall or a desk, or the wall of an ice rink (Fig. 4-9), can exert a force. The explanation is that every material, no matter how hard, is elastic (springy) at least to some degree. A stretched rubber band can exert a force on a wad of paper and accelerate it to fly across the room. Other materials may not stretch as readily as rubber, but they do stretch or compress when a force is applied to them. And just as a stretched rubber band exerts a force, so does a stretched (or compressed) wall, desk, or car fender.

From the examples discussed above, we can see how important it is to remember on what object a given force is exerted and by what object that force is exerted. A force influences the motion of an object only when it is applied on that object. A force exerted by an object does not influence that same object; it only influences the other object on which it is exerted. Thus, to avoid confusion, the two prepositions on and by must always be used-and used with care.

One way to keep clear which force acts on which object is to use double subscripts. For example, the force exerted on the Person by the Ground as the person walks in Fig. $4^{4-11}$ can be labeled $\overrightarrow{\mathbf{F}}_{\mathrm{PG}}$. And the force exerted on the ground by the person is $\overrightarrow{\mathbf{F}}_{\mathrm{GP}}$. By Newton's third law

$$
\begin{equation*}
\overrightarrow{\mathbf{F}}_{\mathrm{GP}}=-\overrightarrow{\mathbf{F}}_{\mathrm{PG}} \tag{4-2}
\end{equation*}
$$

$\overrightarrow{\mathbf{F}}_{\mathrm{GP}}$ and $\overrightarrow{\mathbf{F}}_{\mathrm{PG}}$ have the same magnitude (Newton's third law), and the minus sign reminds us that these two forces are in opposite directions.

Note carefully that the two forces shown in Fig. 4-11 act on different objects-to emphasize this we used slightly different colors for the vector arrows representing these forces. These two forces would never appear together in a sum of forces in Newton's second law, $\Sigma \overrightarrow{\mathbf{F}}=m \overrightarrow{\mathbf{a}}$. Why not? Because they act on different objects: $\overrightarrow{\mathbf{a}}$ is the acceleration of one particular object, and $\Sigma \overrightarrow{\mathbf{F}}$ must include only the forces on that one object.

CONCEPTUAL EXAMPLE 4-5 Third law clarification. Michelangelo's assistant has been assigned the task of moving a block of marble using a sled (Fig. 4-12). He says to his boss, "When I exert a forward force on the sled, the sled exerts an equal and opposite force backward. So how can I ever start it moving? No matter how hard I pull, the backward reaction force always equals my forward force, so the net force must be zero. I'll never be able to move this load." Is he correct?
RESPONSE No. Although it is true that the action and reaction forces are equal in magnitude, the assistant has forgotten that they are exerted on different objects. The forward ("action") force is exerted by the assistant on the sled (Fig. 4-12), whereas the backward "reaction" force is exerted by the sled on the assistant. To determine if the assistant moves or not, we must consider only the forces on the assistant and then apply $\Sigma \overrightarrow{\mathbf{F}}=m \overrightarrow{\mathbf{a}}$, where $\Sigma \overrightarrow{\mathbf{F}}$ is the net force on the assistant, $\overrightarrow{\mathbf{a}}$ is the acceleration of the assistant, and $m$ is the assistant's mass. There are two forces on the assistant that affect his forward motion; they are shown as bright red (magenta) arrows in Figs. 4-12 and 4-13: they are (1) the horizontal force $\overrightarrow{\mathbf{F}}_{\mathrm{AG}}$ exerted on the assistant by the ground (the harder he pushes backward against the ground, the harder the ground pushes forward on himNewton's third law), and (2) the force $\overrightarrow{\mathbf{F}}_{\mathrm{AS}}$ exerted on the assistant by the sled, pulling backward on him; see Fig. 4-13. If he pushes hard enough on the ground, the force on him exerted by the ground, $\overrightarrow{\mathbf{F}}_{\mathrm{AG}}$, will be larger than the sled pulling back, $\overrightarrow{\mathbf{F}}_{\mathrm{AS}}$, and the assistant accelerates forward (Newton's second law). The sled, on the other hand, accelerates forward when the force on it exerted by the assistant is greater than the frictional force exerted backward on it by the ground (that is, when $\overrightarrow{\mathbf{F}}_{\mathrm{SA}}$ has greater magnitude than $\overrightarrow{\mathbf{F}}_{\mathrm{SG}}$ in Fig. 4-12).

Using double subscripts to clarify Newton's third law can become cumbersome, and we won't usually use them in this way. We will usually use a single subscript referring to what exerts the force on the object being discussed. Nevertheless, if there is any confusion in your mind about a given force, go ahead and use two subscripts to identify on what object and by what object the force is exerted.

EXERCISE B Return to the first Chapter-Opening Question, page 75, and answer it again now. Try to explain why you may have answered differently the first time.

EXERCISE C A tennis ball collides head-on with a more massive baseball. (i) Which ball experiences the greater force of impact? (ii) Which experiences the greater acceleration during the impact? (iii) Which of Newton's laws are useful to obtain the correct answers?

EXERCISE D If you push on a heavy desk, does it always push back on you? (a) No. (b) Yes. (c) Not unless someone else also pushes on it. (d) Yes, if it is out in space. (e) A desk never pushes to start with.

FIGURE 4-12 Example 4-5, showing only horizontal forces. Michelangelo has selected a fine block of marble for his next sculpture. Shown here is his assistant pulling it on a sled away from the quarry. Forces on the assistant are shown as red (magenta) arrows. Forces on the sled are purple arrows. Forces acting on the ground are orange arrows. Action-reaction forces that are equal and opposite are labeled by the same subscripts but reversed (such as $\overrightarrow{\mathbf{F}}_{\mathrm{GA}}$ and $\overrightarrow{\mathbf{F}}_{\mathrm{AG}}$ ) and are of different colors because they act on different objects.

PROBLEM SOLVING A study of Newton's second and third laws

FIGURE 4-13 Example 4-5. The horizontal forces on the assistant.

## 4-6 Weight-the Force of Gravity; and the Normal Force

(a)

(b)

FIGURE 4-14 (a) The net force on an object at rest is zero according to Newton's second law. Therefore the downward force of gravity $\left(\overrightarrow{\mathbf{F}}_{\mathrm{G}}\right)$ on an object at rest must be balanced by an upward force (the normal force $\overrightarrow{\mathbf{F}}_{\mathrm{N}}$ ) exerted by the table in this case. (b) $\overrightarrow{\mathbf{F}}_{\mathrm{N}}^{\prime}$ is the force exerted on the table by the statue and is the reaction force to $\overrightarrow{\mathbf{F}}_{\mathrm{N}}$ by Newton's third law. ( $\overrightarrow{\mathbf{F}}_{\mathrm{N}}^{\prime}$ is shown in a different color to remind us it acts on a different object.) The reaction force to $\overrightarrow{\mathbf{F}}_{\mathrm{G}}$ is not shown.

C A U T I O N
Weight and normal force are not action-reaction pairs

As we saw in Chapter 2, Galileo claimed that all objects dropped near the surface of the Earth would fall with the same acceleration, $\overrightarrow{\mathbf{g}}$, if air resistance was negligible. The force that causes this acceleration is called the force of gravity or gravitational force. What exerts the gravitational force on an object? It is the Earth, as we will discuss in Chapter 5, and the force acts vertically ${ }^{\dagger}$ downward, toward the center of the Earth. Let us apply Newton's second law to an object of mass $m$ falling freely due to gravity. For the acceleration, $\overrightarrow{\mathbf{a}}$, we use the downward acceleration due to gravity, $\overrightarrow{\mathbf{g}}$. Thus, the gravitational force on an object, $\overrightarrow{\mathbf{F}}_{\mathrm{G}}$, can be written as

$$
\begin{equation*}
\overrightarrow{\mathbf{F}}_{\mathrm{G}}=m \overrightarrow{\mathbf{g}} . \tag{4-3}
\end{equation*}
$$

The direction of this force is down toward the center of the Earth. The magnitude of the force of gravity on an object, $m g$, is commonly called the object's weight.

In SI units, $g=9.80 \mathrm{~m} / \mathrm{s}^{2}=9.80 \mathrm{~N} / \mathrm{kg}{ }^{\ddagger}{ }^{\ddagger}$ so the weight of a $1.00-\mathrm{kg}$ mass on Earth is $1.00 \mathrm{~kg} \times 9.80 \mathrm{~m} / \mathrm{s}^{2}=9.80 \mathrm{~N}$. We will mainly be concerned with the weight of objects on Earth, but we note that on the Moon, on other planets, or in space, the weight of a given mass will be different than it is on Earth. For example, on the Moon the acceleration due to gravity is about one-sixth what it is on Earth, and a $1.0-\mathrm{kg}$ mass weighs only 1.6 N . Although we will not use British units, we note that for practical purposes on the Earth, a mass of 1.0 kg weighs about 2.2 lb . (On the Moon, 1 kg weighs only about 0.4 lb .)

The force of gravity acts on an object when it is falling. When an object is at rest on the Earth, the gravitational force on it does not disappear, as we know if we weigh it on a spring scale. The same force, given by Eq. 4-3, continues to act. Why, then, doesn't the object move? From Newton's second law, the net force on an object that remains at rest is zero. There must be another force on the object to balance the gravitational force. For an object resting on a table, the table exerts this upward force; see Fig. 4-14a. The table is compressed slightly beneath the object, and due to its elasticity, it pushes up on the object as shown. The force exerted by the table is often called a contact force, since it occurs when two objects are in contact. (The force of your hand pushing on a cart is also a contact force.) When a contact force acts perpendicular to the common surface of contact, it is referred to as the normal force ("normal" means perpendicular); hence it is labeled $\overrightarrow{\mathbf{F}}_{\mathrm{N}}$ in Fig. 4-14a.

The two forces shown in Fig. 4-14a are both acting on the statue, which remains at rest, so the vector sum of these two forces must be zero (Newton's second law). Hence $\overrightarrow{\mathbf{F}}_{\mathrm{G}}$ and $\overrightarrow{\mathbf{F}}_{\mathrm{N}}$ must be of equal magnitude and in opposite directions. But they are not the equal and opposite forces spoken of in Newton's third law. The action and reaction forces of Newton's third law act on different objects, whereas the two forces shown in Fig. 4-14a act on the same object. For each of the forces shown in Fig. 4-14a, we can ask, "What is the reaction force?" The upward force $\overrightarrow{\mathbf{F}}_{\mathrm{N}}$ on the statue is exerted by the table. The reaction to this force is a force exerted by the statue downward on the table. It is shown in Fig. 4-14b, where it is labeled $\overrightarrow{\mathbf{F}}_{\mathrm{N}}^{\prime}$. This force, $\overrightarrow{\mathbf{F}}_{\mathrm{N}}^{\prime}$, exerted on the table by the statue, is the reaction force to $\overrightarrow{\mathbf{F}}_{\mathrm{N}}$ in accord with Newton's third law. What about the other force on the statue, the force of gravity $\overrightarrow{\mathbf{F}}_{\mathrm{G}}$ exerted by the Earth? Can you guess what the reaction is to this force? We will see in Chapter 5 that the reaction force is also a gravitational force, exerted on the Earth by the statue.

EXERCISE E Return to the second Chapter-Opening Question, page 75, and answer it again now. Try to explain why you may have answered differently the first time.

[^3]EXAMPLE 4-6 Weight, normal force, and a box. A friend has given you a special gift, a box of mass 10.0 kg with a mystery surprise inside. The box is resting on the smooth (frictionless) horizontal surface of a table (Fig. 4-15a). (a) Determine the weight of the box and the normal force exerted on it by the table. (b) Now your friend pushes down on the box with a force of 40.0 N , as in Fig. 4-15b. Again determine the normal force exerted on the box by the table. (c) If your friend pulls upward on the box with a force of 40.0 N (Fig. $4-15 \mathrm{c}$ ), what now is the normal force exerted on the box by the table?
APPROACH The box is at rest on the table, so the net force on the box in each case is zero (Newton's first or second law). The weight of the box has magnitude $m g$ in all three cases.
SOLUTION $(a)$ The weight of the box is $m g=(10.0 \mathrm{~kg})\left(9.80 \mathrm{~m} / \mathrm{s}^{2}\right)=98.0 \mathrm{~N}$, and this force acts downward. The only other force on the box is the normal force exerted upward on it by the table, as shown in Fig. 4-15a. We chose the upward direction as the positive $y$ direction; then the net force $\Sigma F_{y}$ on the box is $\Sigma F_{y}=F_{\mathrm{N}}-m g$; the minus sign means $m g$ acts in the negative $y$ direction ( $m$ and $g$ are magnitudes). The box is at rest, so the net force on it must be zero (Newton's second law, $\Sigma F_{y}=m a_{y}$, and $a_{y}=0$ ). Thus

$$
\begin{aligned}
\Sigma F_{y} & =m a_{y} \\
F_{\mathrm{N}}-m g & =0
\end{aligned}
$$

so we have

$$
F_{\mathrm{N}}=m g .
$$

The normal force on the box, exerted by the table, is 98.0 N upward, and has magnitude equal to the box's weight.
(b) Your friend is pushing down on the box with a force of 40.0 N . So instead of only two forces acting on the box, now there are three forces acting on the box, as shown in Fig. 4-15b. The weight of the box is still $m g=98.0$ N. The net force is $\Sigma F_{y}=F_{\mathrm{N}}-m g-40.0 \mathrm{~N}$, and is equal to zero because the box remains at rest $(a=0)$. Newton's second law gives

$$
\Sigma F_{y}=F_{\mathrm{N}}-m g-40.0 \mathrm{~N}=0
$$

We solve this equation for the normal force:

$$
F_{\mathrm{N}}=m g+40.0 \mathrm{~N}=98.0 \mathrm{~N}+40.0 \mathrm{~N}=138.0 \mathrm{~N},
$$

which is greater than in $(a)$. The table pushes back with more force when a person pushes down on the box. The normal force is not always equal to the weight!
(c) The box's weight is still 98.0 N and acts downward. The force exerted by your friend and the normal force both act upward (positive direction), as shown in Fig. 4-15c. The box doesn't move since your friend's upward force is less than the weight. The net force, again set to zero in Newton's second law because $a=0$, is

$$
\Sigma F_{y}=F_{\mathrm{N}}-m g+40.0 \mathrm{~N}=0
$$

so

$$
F_{\mathrm{N}}=m g-40.0 \mathrm{~N}=98.0 \mathrm{~N}-40.0 \mathrm{~N}=58.0 \mathrm{~N} .
$$

The table does not push against the full weight of the box because of the upward force exerted by your friend.
NOTE The weight of the box $(=m g)$ does not change as a result of your friend's push or pull. Only the normal force is affected.

Recall that the normal force is elastic in origin (the table in Fig. 4-15 sags slightly under the weight of the box). The normal force in Example 4-6 is vertical, perpendicular to the horizontal table. The normal force is not always vertical, however. When you push against a wall, for example, the normal force with which the wall pushes back on you is horizontal (Fig. 4-9). For an object on a plane inclined at an angle to the horizontal, such as a skier or car on a hill, the normal force acts perpendicular to the plane and so is not vertical.

(a) $\Sigma F_{y}=F_{\mathrm{N}}-m g=0$

(b) $\Sigma F_{y}=F_{\mathrm{N}}-m g-40.0 \mathrm{~N}=0$

(c) $\Sigma F_{y}=F_{\mathrm{N}}-m g+40.0 \mathrm{~N}=0$

FIGURE 4-15 Example 4-6.
(a) A $10-\mathrm{kg}$ gift box is at rest on a table. (b) A person pushes down on the box with a force of 40.0 N .
(c) A person pulls upward on the box with a force of 40.0 N . The forces are all assumed to act along a line; they are shown slightly displaced in order to be distinguishable. Only forces acting on the box are shown.

CAUTION
The normal force is not always equal to the weight

## CAUTION

The normal force, $\overrightarrow{\mathbf{F}}_{\mathrm{N}}$, is not necessarily vertical

FIGURE 4-16 Example 4-7. The box accelerates upward because $F_{\mathrm{P}}>m g$.

FIGURE 4-17 Example 4-8. The acceleration vector is shown in gold to distinguish it from the red force vectors.

EXAMPLE 4-7 Accelerating the box. What happens when a person pulls upward on the box in Example $4-6 c$ with a force equal to, or greater than, the box's weight? For example, let $F_{\mathrm{P}}=100.0 \mathrm{~N}$ (Fig. 4-16) rather than the 40.0 N shown in Fig. 4-15c.

APPROACH We can start just as in Example 4-6, but be ready for a surprise.
SOLUTION The net force on the box is

$$
\begin{aligned}
\Sigma F_{y} & =F_{\mathrm{N}}-m g+F_{\mathrm{P}} \\
& =F_{\mathrm{N}}-98.0 \mathrm{~N}+100.0 \mathrm{~N}
\end{aligned}
$$

and if we set this equal to zero (thinking the acceleration might be zero), we would get $F_{\mathrm{N}}=-2.0 \mathrm{~N}$. This is nonsense, since the negative sign implies $F_{\mathrm{N}}$ points downward, and the table surely cannot pull down on the box (unless there's glue on the table). The least $F_{\mathrm{N}}$ can be is zero, which it will be in this case. What really happens here is that the box accelerates upward $(a \neq 0)$ because the net force is not zero. The net force (setting the normal force $F_{\mathrm{N}}=0$ ) is

$$
\begin{aligned}
\Sigma F_{y}=F_{\mathrm{P}}-m g & =100.0 \mathrm{~N}-98.0 \mathrm{~N} \\
& =2.0 \mathrm{~N}
\end{aligned}
$$

upward. See Fig. 4-16. We apply Newton's second law and see that the box moves upward with an acceleration

$$
\begin{aligned}
a_{y}=\frac{\Sigma F_{y}}{m} & =\frac{2.0 \mathrm{~N}}{10.0 \mathrm{~kg}} \\
& =0.20 \mathrm{~m} / \mathrm{s}^{2}
\end{aligned}
$$

EXAMPLE 4-8 Apparent weight loss. A $65-\mathrm{kg}$ woman descends in an elevator that briefly accelerates at $0.20 g$ downward. She stands on a scale that reads in kg . (a) During this acceleration, what is her weight and what does the scale read? (b) What does the scale read when the elevator descends at a constant speed of $2.0 \mathrm{~m} / \mathrm{s}$ ?
APPROACH Figure 4-17 shows all the forces that act on the woman (and only those that act on her). The direction of the acceleration is downward, so we choose the positive direction as down (this is the opposite choice from Examples 4-6 and 4-7).
SOLUTION (a) From Newton's second law,

$$
\begin{aligned}
\Sigma F & =m a \\
m g-F_{\mathrm{N}} & =m(0.20 g)
\end{aligned}
$$

We solve for $F_{\mathrm{N}}$ :

$$
\begin{aligned}
F_{\mathrm{N}} & =m g-0.20 m g \\
& =0.80 \mathrm{mg}
\end{aligned}
$$

and it acts upward. The normal force $\overrightarrow{\mathbf{F}}_{\mathrm{N}}$ is the force the scale exerts on the person, and is equal and opposite to the force she exerts on the scale: $F_{\mathrm{N}}^{\prime}=0.80 \mathrm{mg}$ downward. Her weight (force of gravity on her) is still $m g=(65 \mathrm{~kg})\left(9.8 \mathrm{~m} / \mathrm{s}^{2}\right)=640 \mathrm{~N}$. But the scale, needing to exert a force of only 0.80 mg , will give a reading of $0.80 \mathrm{~m}=52 \mathrm{~kg}$.
(b) Now there is no acceleration, $a=0$, so by Newton's second law, $m g-F_{\mathrm{N}}=0$ and $F_{\mathrm{N}}=m g$. The scale reads her true mass of 65 kg .
NOTE The scale in (a) gives a reading of 52 kg (as an "apparent mass"), but her mass doesn't change as a result of the acceleration: it stays at 65 kg .

## 4-7 Solving Problems with Newton's Laws: Free-Body Diagrams

Newton's second law tells us that the acceleration of an object is proportional to the net force acting on the object. The net force, as mentioned earlier, is the vector sum of all forces acting on the object. Indeed, extensive experiments have shown that forces do add together as vectors precisely according to the rules we developed in Chapter 3. For example, in Fig. 4-18, two forces of equal magnitude ( 100 N each) are shown acting on an object at right angles to each other. Intuitively, we can see that the object will start moving at a $45^{\circ}$ angle and thus the net force acts at a $45^{\circ}$ angle. This is just what the rules of vector addition give. From the theorem of Pythagoras, the magnitude of the resultant force is $F_{\mathrm{R}}=\sqrt{(100 \mathrm{~N})^{2}+(100 \mathrm{~N})^{2}}=141 \mathrm{~N}$.

EXAMPLE 4-9 Adding force vectors. Calculate the sum of the two forces exerted on the boat by workers A and B in Fig. 4-19a.
APPROACH We add force vectors like any other vectors as described in Chapter 3. The first step is to choose an $x y$ coordinate system (see Fig. 4-19a), and then resolve vectors into their components.
SOLUTION The two force vectors are shown resolved into components in Fig. 4-19b. We add the forces using the method of components. The components of $\overrightarrow{\mathbf{F}}_{\mathrm{A}}$ are

$$
\begin{aligned}
& F_{\mathrm{A} x}=F_{\mathrm{A}} \cos 45.0^{\circ}=(40.0 \mathrm{~N})(0.707)=28.3 \mathrm{~N}, \\
& F_{\mathrm{A} y}=F_{\mathrm{A}} \sin 45.0^{\circ}=(40.0 \mathrm{~N})(0.707)=28.3 \mathrm{~N} .
\end{aligned}
$$

The components of $\overrightarrow{\mathbf{F}}_{\mathrm{B}}$ are

$$
\begin{aligned}
& F_{\mathrm{B} x}=+F_{\mathrm{B}} \cos 37.0^{\circ}=+(30.0 \mathrm{~N})(0.799)=+24.0 \mathrm{~N}, \\
& F_{\mathrm{B} y}=-F_{\mathrm{B}} \sin 37.0^{\circ}=-(30.0 \mathrm{~N})(0.602)=-18.1 \mathrm{~N} .
\end{aligned}
$$

$F_{\mathrm{B} y}$ is negative because it points along the negative $y$ axis. The components of the resultant force are (see Fig. 4-19c)

$$
\begin{aligned}
& F_{\mathrm{R} x}=F_{\mathrm{A} x}+F_{\mathrm{B} x}=28.3 \mathrm{~N}+24.0 \mathrm{~N}=52.3 \mathrm{~N}, \\
& F_{\mathrm{R} y}=F_{\mathrm{A} y}+F_{\mathrm{B} y}=28.3 \mathrm{~N}-18.1 \mathrm{~N}=10.2 \mathrm{~N} .
\end{aligned}
$$

To find the magnitude of the resultant force, we use the Pythagorean theorem,

$$
F_{\mathrm{R}}=\sqrt{F_{\mathrm{R} x}^{2}+F_{\mathrm{R} y}^{2}}=\sqrt{(52.3)^{2}+(10.2)^{2}} \mathrm{~N}=53.3 \mathrm{~N} .
$$

The only remaining question is the angle $\theta$ that the net force $\overrightarrow{\mathbf{F}}_{\mathrm{R}}$ makes with the $x$ axis. We use:

$$
\tan \theta=\frac{F_{\mathrm{R} y}}{F_{\mathrm{R} x}}=\frac{10.2 \mathrm{~N}}{52.3 \mathrm{~N}}=0.195,
$$

and $\tan ^{-1}(0.195)=11.0^{\circ}$. The net force on the boat has magnitude 53.3 N and acts at an $11.0^{\circ}$ angle to the $x$ axis.

When solving problems involving Newton's laws and force, it is very important to draw a diagram showing all the forces acting on each object involved. Such a diagram is called a free-body diagram, or force diagram: choose one object, and draw an arrow to represent each force acting on it. Include every force acting on that object. Do not show forces that the chosen object exerts on other objects. To help you identify each and every force that is exerted on your chosen object, ask yourself what other objects could exert a force on it. If your problem involves more than one object, a separate free-body diagram is needed for each object. For now, the likely forces that could be acting are gravity and contact forces (one object pushing or pulling another, normal force, friction). Later we will consider other types of force such as buoyancy, fluid pressure, and electric and magnetic forces.

FIGURE 4-18 (a) Two horizontal forces, $\overrightarrow{\mathbf{F}}_{\mathrm{A}}$ and $\overrightarrow{\mathbf{F}}_{\mathrm{B}}$, exerted by workers A and B, act on a crate (we are looking down from above). (b) The sum, or resultant, of $\overrightarrow{\mathbf{F}}_{\mathrm{A}}$ and $\overrightarrow{\mathbf{F}}_{\mathrm{B}}$ is $\overrightarrow{\mathbf{F}}_{\mathrm{R}}$.

FIGURE 4-19 Example 4-9: Two force vectors act on a boat.

(a)

(b)

(c)

PROBLEM SOLVING Free-body diagram

FIGURE 4-20 Example 4-10. Which is the correct free-body diagram for a hockey puck sliding across frictionless ice?

CONCEPTUAL EXAMPLE 4-10 The hockey puck. A hockey puck is sliding at constant velocity across a flat horizontal ice surface that is assumed to be frictionless. Which of the sketches in Fig. 4-20 is the correct free-body diagram for this puck? What would your answer be if the puck slowed down?
RESPONSE Did you choose $(a)$ ? If so, can you answer the question: what exerts the horizontal force labeled $\overrightarrow{\mathbf{F}}$ on the puck? If you say that it is the force needed to maintain the motion, ask yourself: what exerts this force? Remember that another object must exert any force-and there simply isn't any possibility here. Therefore, $(a)$ is wrong. Besides, the force $\overrightarrow{\mathbf{F}}$ in Fig. 4-20a would give rise to an acceleration by Newton's second law. It is $(b)$ that is correct. No net force acts on the puck, and the puck slides at constant velocity across the ice.

In the real world, where even smooth ice exerts at least a tiny friction force, then $(c)$ is the correct answer. The tiny friction force is in the direction opposite to the motion, and the puck's velocity decreases, even if very slowly.

## Newton's Laws; Free-Body Diagrams

1. Draw a sketch of the situation, after carefully reading the Problem at least twice.
2. Consider only one object (at a time), and draw a free-body diagram for that object, showing all the forces acting on that object. Include any unknown forces that you have to solve for. Do not show any forces that the chosen object exerts on other objects.

Draw the arrow for each force vector reasonably accurately for direction and magnitude. Label each force acting on the object, including forces you must solve for, according to its source (gravity, person, friction, and so on).

If several objects are involved, draw a free-body diagram for each object separately. For each object, show all the forces acting on that object (and only forces acting on that object). For each (and every) force, you must be clear about: on what object that
force acts, and by what object that force is exerted. Only forces acting on a given object can be included in $\Sigma \overrightarrow{\mathbf{F}}=m \overrightarrow{\mathbf{a}}$ for that object.
3. Newton's second law involves vectors, and it is usually important to resolve vectors into components. Choose $x$ and $y$ axes in a way that simplifies the calculation. For example, it often saves work if you choose one coordinate axis to be in the direction of the acceleration (if known).
4. For each object, apply Newton's second law to the $x$ and $y$ components separately. That is, the $x$ component of the net force on that object is related to the $x$ component of that object's acceleration: $\Sigma F_{x}=m a_{x}$, and similarly for the $y$ direction.
5. Solve the equation or equations for the unknown(s). Put in numerical values only at the end, and keep track of units.

CAUTION
Treating an object as a particle

This Problem Solving Strategy should not be considered a prescription. Rather it is a summary of things to do that will start you thinking and getting involved in the problem at hand.

When we are concerned only about translational motion, all the forces on a given object can be drawn as acting at the center of the object, thus treating the object as a point particle. However, for problems involving rotation or statics, the place where each force acts is also important, as we shall see in Chapters 8 and 9 .

In the Examples in this Section, we assume that all surfaces are very smooth so that friction can be ignored. (Friction, and Examples using it, are discussed in Section 4-8.)

EXAMPLE 4-11 Pulling the mystery box. Suppose a friend asks to examine the $10.0-\mathrm{kg}$ box you were given (Example 4-6, Fig. 4-15), hoping to guess what is inside; and you respond, "Sure, pull the box over to you." She then pulls the box by the attached cord, as shown in Fig. 4-21a, along the smooth surface of the table. The magnitude of the force exerted by the person is $F_{\mathrm{P}}=40.0 \mathrm{~N}$, and it is exerted at a $30.0^{\circ}$ angle as shown. Calculate $(a)$ the acceleration of the box, and $(b)$ the magnitude of the upward force $F_{\mathrm{N}}$ exerted by the table on the box. Assume that friction can be neglected.
APPROACH We follow the Problem Solving Strategy on the previous page.

## SOLUTION

1. Draw a sketch: The situation is shown in Fig. 4-21a; it shows the box and the force applied by the person, $F_{\mathrm{P}}$.
2. Free-body diagram: Figure $4-21$ b shows the free-body diagram of the box. To draw it correctly, we show all the forces acting on the box and only the forces acting on the box. They are: the force of gravity $m \overrightarrow{\mathbf{g}}$; the normal force exerted by the table $\overrightarrow{\mathbf{F}}_{\mathrm{N}}$; and the force exerted by the person $\overrightarrow{\mathbf{F}}_{\mathrm{P}}$. We are interested only in translational motion, so we can show the three forces acting at a point, Fig. 4-21c.
3. Choose axes and resolve vectors: We expect the motion to be horizontal, so we choose the $x$ axis horizontal and the $y$ axis vertical. The pull of 40.0 N has components

$$
\begin{aligned}
& F_{\mathrm{P} x}=(40.0 \mathrm{~N})\left(\cos 30.0^{\circ}\right)=(40.0 \mathrm{~N})(0.866)=34.6 \mathrm{~N} \\
& F_{\mathrm{P} y}=(40.0 \mathrm{~N})\left(\sin 30.0^{\circ}\right)=(40.0 \mathrm{~N})(0.500)=20.0 \mathrm{~N}
\end{aligned}
$$

In the horizontal $(x)$ direction, $\overrightarrow{\mathbf{F}}_{\mathrm{N}}$ and $m \overrightarrow{\mathbf{g}}$ have zero components. Thus the horizontal component of the net force is $F_{\mathrm{P} x}$.
4. (a) Apply Newton's second law to get the $x$ component of the acceleration:

$$
F_{\mathrm{P} x}=m a_{x} .
$$

5. (a) Solve:

$$
a_{x}=\frac{F_{\mathrm{P} x}}{m}=\frac{(34.6 \mathrm{~N})}{(10.0 \mathrm{~kg})}=3.46 \mathrm{~m} / \mathrm{s}^{2}
$$

The acceleration of the box is $3.46 \mathrm{~m} / \mathrm{s}^{2}$ to the right.
(b) Next we want to find $F_{\mathrm{N}}$.

4'. (b) Apply Newton's second law to the vertical ( $y$ ) direction, with upward as positive:

$$
\begin{aligned}
\Sigma F_{y} & =m a_{y} \\
F_{\mathrm{N}}-m g+F_{\mathrm{P} y} & =m a_{y}
\end{aligned}
$$

$\mathbf{5}^{\prime}$. (b) Solve: We have $m g=(10.0 \mathrm{~kg})\left(9.80 \mathrm{~m} / \mathrm{s}^{2}\right)=98.0 \mathrm{~N}$ and, from point 3 above, $F_{\mathrm{P} y}=20.0 \mathrm{~N}$. Furthermore, since $F_{\mathrm{P} y}<m g$, the box does not move vertically, so $a_{y}=0$. Thus

$$
F_{\mathrm{N}}-98.0 \mathrm{~N}+20.0 \mathrm{~N}=0
$$

so

$$
F_{\mathrm{N}}=78.0 \mathrm{~N}
$$

NOTE $F_{\mathrm{N}}$ is less than $m g$ : the table does not push against the full weight of the box because part of the pull exerted by the person is in the upward direction.

EXERCISE F A $10.0-\mathrm{kg}$ box is dragged on a horizontal frictionless surface by a horizontal force of 10.0 N . If the applied force is doubled, the normal force on the box will ( $a$ ) increase; ( $b$ ) remain the same; (c) decrease.

## Tension in a Flexible Cord

When a flexible cord pulls on an object, the cord is said to be under tension, and the force it exerts on the object is the tension $F_{\mathrm{T}}$. If the cord has negligible mass, the force exerted at one end is transmitted undiminished to each adjacent piece of cord along the entire length to the other end. Why? Because $\Sigma \overrightarrow{\mathbf{F}}=m \overrightarrow{\mathbf{a}}=0$ for the cord if the cord's mass $m$ is zero (or negligible) no matter what $\overrightarrow{\mathbf{a}}$ is. Hence the forces pulling on the cord at its two ends must add up to zero ( $F_{\mathrm{T}}$ and $-F_{\mathrm{T}}$ ). Note that flexible cords and strings can only pull. They can't push because they bend.

(a)

(b)

FIGURE 4-21 (a) Pulling the box, Example 4-11; (b) is the free-body diagram for the box, and (c) is the free-body diagram considering all the forces to act at a point (translational motion only, which is what we have here).

FIGURE 4-22 Example 4-12. (a) Two boxes, A and B, are connected by a cord. A person pulls horizontally on box A with force $F_{\mathrm{P}}=40.0 \mathrm{~N}$. (b) Free-body diagram for box A. (c) Free-body diagram for box B .
(a) Our next Example involves two boxes connected by a cord. We can refer to

CAUTION
For any object, use only the forces on that object in calculating $\Sigma F=m a$
this group of objects as a system. A system is any group of one or more objects we choose to consider and study.

EXAMPLE 4-12 Two boxes connected by a cord. Two boxes, A and B, are connected by a lightweight cord and are resting on a smooth (frictionless) table. The boxes have masses of 12.0 kg and 10.0 kg . A horizontal force $F_{\mathrm{P}}$ of 40.0 N is applied to the $10.0-\mathrm{kg}$ box, as shown in Fig. $4-22 \mathrm{a}$. Find (a) the acceleration of each box, and $(b)$ the tension in the cord connecting the boxes.
APPROACH We streamline our approach by not listing each step. We have two boxes so we draw a free-body diagram for each. To draw them correctly, we must consider the forces on each box by itself, so that Newton's second law can be applied to each. The person exerts a force $F_{\mathrm{P}}$ on box A. Box A exerts a force $F_{\mathrm{T}}$ on the connecting cord, and the cord exerts an opposite but equal magnitude force $F_{\mathrm{T}}$ back on box A (Newton's third law). The two horizontal forces on box A are shown in Fig. 4-22b, along with the force of gravity $m_{\mathrm{A}} \overrightarrow{\mathbf{g}}$ downward and the normal force $\overrightarrow{\mathbf{F}}_{\mathrm{AN}}$ exerted upward by the table. The cord is light, so we neglect its mass. The tension at each end of the cord is thus the same. Hence the cord exerts a force $F_{\mathrm{T}}$ on the second box. Figure 4-22c shows the forces on box B, which are $\overrightarrow{\mathbf{F}}_{\mathrm{T}}, m_{\mathrm{B}} \overrightarrow{\mathbf{g}}$, and the normal force $\overrightarrow{\mathbf{F}}_{\mathrm{BN}}$. There will be only horizontal motion. We take the positive $x$ axis to the right.
SOLUTION (a) We apply $\Sigma F_{x}=m a_{x}$ to box A:

$$
\begin{equation*}
\Sigma F_{x}=F_{\mathrm{P}}-F_{\mathrm{T}}=m_{\mathrm{A}} a_{\mathrm{A}} \tag{boxA}
\end{equation*}
$$

For box B , the only horizontal force is $F_{\mathrm{T}}$, so

$$
\begin{equation*}
\Sigma F_{x}=F_{\mathrm{T}}=m_{\mathrm{B}} a_{\mathrm{B}} \tag{boxB}
\end{equation*}
$$

The boxes are connected, and if the cord remains taut and doesn't stretch, then the two boxes will have the same acceleration $a$. Thus $a_{\mathrm{A}}=a_{\mathrm{B}}=a$. We are given $m_{\mathrm{A}}=10.0 \mathrm{~kg}$ and $m_{\mathrm{B}}=12.0 \mathrm{~kg}$. We can add the two equations above to eliminate an unknown $\left(F_{\mathrm{T}}\right)$ and obtain

$$
\left(m_{\mathrm{A}}+m_{\mathrm{B}}\right) a=F_{\mathrm{P}}-F_{\mathrm{T}}+F_{\mathrm{T}}=F_{\mathrm{P}}
$$

or

$$
a=\frac{F_{\mathrm{P}}}{m_{\mathrm{A}}+m_{\mathrm{B}}}=\frac{40.0 \mathrm{~N}}{22.0 \mathrm{~kg}}=1.82 \mathrm{~m} / \mathrm{s}^{2}
$$

This is what we sought.
(b) From the equation for box B above $\left(F_{\mathrm{T}}=m_{\mathrm{B}} a_{\mathrm{B}}\right)$, the tension in the cord is

$$
F_{\mathrm{T}}=m_{\mathrm{B}} a=(12.0 \mathrm{~kg})\left(1.82 \mathrm{~m} / \mathrm{s}^{2}\right)=21.8 \mathrm{~N}
$$

Thus, $F_{\mathrm{T}}<F_{\mathrm{P}}(=40.0 \mathrm{~N})$, as we expect, since $F_{\mathrm{T}}$ acts to accelerate only $m_{\mathrm{B}}$.
Alternate Solution to (a) We would have obtained the same result had we considered a single system, of mass $m_{\mathrm{A}}+m_{\mathrm{B}}$, acted on by a net horizontal force equal to $F_{\mathrm{P}}$. (The tension forces $F_{\mathrm{T}}$ would then be considered internal to the system as a whole, and summed together would make zero contribution to the net force on the whole system.)
NOTE It might be tempting to say that the force the person exerts, $F_{\mathrm{P}}$, acts not only on box A but also on box B. It doesn't. $F_{\mathrm{P}}$ acts only on box A. It affects box B via the tension in the cord, $F_{\mathrm{T}}$, which acts on box B and accelerates it. (You could look at it this way: $F_{\mathrm{T}}<F_{\mathrm{P}}$ because $F_{\mathrm{P}}$ accelerates both boxes whereas $F_{\mathrm{T}}$ only accelerates box B .)

EXAMPLE 4-13 Elevator and counterweight (Atwood machine). A system of two objects suspended over a pulley by a flexible cable, as shown in Fig. 4-23a, is sometimes referred to as an Atwood machine. Consider the real-life application of an elevator $\left(m_{\mathrm{E}}\right)$ and its counterweight $\left(m_{\mathrm{C}}\right)$. To minimize the work done by the motor to raise and lower the elevator safely, $m_{\mathrm{E}}$ and $m_{\mathrm{C}}$ are made similar in mass. We leave the motor out of the system for this calculation, and assume that the cable's mass is negligible and that the mass of the pulley, as well as any friction, is small and ignorable. These assumptions ensure that the tension $F_{\mathrm{T}}$ in the cable has the same magnitude on both sides of the pulley. Let the mass of the counterweight be $m_{\mathrm{C}}=1000 \mathrm{~kg}$. Assume the mass of the empty elevator is 850 kg , and its mass when carrying four passengers is $m_{\mathrm{E}}=1150 \mathrm{~kg}$. For the latter case $\left(m_{\mathrm{E}}=1150 \mathrm{~kg}\right)$, calculate $(a)$ the acceleration of the elevator and $(b)$ the tension in the cable.
APPROACH Again we have two objects, and we will need to apply Newton's second law to each of them separately. Each mass has two forces acting on it: gravity downward and the cable tension pulling upward, $\overrightarrow{\mathbf{F}}_{\mathrm{T}}$. Figures $4-23 \mathrm{~b}$ and c show the free-body diagrams for the elevator $\left(m_{\mathrm{E}}\right)$ and for the counterweight $\left(m_{\mathrm{C}}\right)$. The elevator, being the heavier, will accelerate downward, whereas the counterweight will accelerate upward. The magnitudes of their accelerations will be equal (we assume the cable is massless and doesn't stretch). For the counterweight, $m_{\mathrm{C}} g=(1000 \mathrm{~kg})\left(9.80 \mathrm{~m} / \mathrm{s}^{2}\right)=9800 \mathrm{~N}$, so $F_{\mathrm{T}}$ must be greater than 9800 N (in order that $m_{\mathrm{C}}$ will accelerate upward). For the elevator, $m_{\mathrm{E}} g=(1150 \mathrm{~kg})\left(9.80 \mathrm{~m} / \mathrm{s}^{2}\right)=11,300 \mathrm{~N}$, which must have greater magnitude than $F_{\mathrm{T}}$ so that $m_{\mathrm{E}}$ accelerates downward. Thus our calculation must give $F_{\mathrm{T}}$ between 9800 N and $11,300 \mathrm{~N}$.
SOLUTION (a) To find $F_{\mathrm{T}}$ as well as the acceleration $a$, we apply Newton's second law, $\Sigma F=m a$, to each object. We take upward as the positive $y$ direction for both objects. With this choice of axes, $a_{\mathrm{C}}=a$ because $m_{\mathrm{C}}$ accelerates upward, and $a_{\mathrm{E}}=-a$ because $m_{\mathrm{E}}$ accelerates downward. Thus

$$
\begin{aligned}
& F_{\mathrm{T}}-m_{\mathrm{E}} g=m_{\mathrm{E}} a_{\mathrm{E}}=-m_{\mathrm{E}} a \\
& F_{\mathrm{T}}-m_{\mathrm{C}} g=m_{\mathrm{C}} a_{\mathrm{C}}=+m_{\mathrm{C}} a .
\end{aligned}
$$

We can subtract the first equation from the second to get

$$
\left(m_{\mathrm{E}}-m_{\mathrm{C}}\right) g=\left(m_{\mathrm{E}}+m_{\mathrm{C}}\right) a
$$

where $a$ is now the only unknown. We solve this for $a$ :

$$
a=\frac{m_{\mathrm{E}}-m_{\mathrm{C}}}{m_{\mathrm{E}}+m_{\mathrm{C}}} g=\frac{1150 \mathrm{~kg}-1000 \mathrm{~kg}}{1150 \mathrm{~kg}+1000 \mathrm{~kg}} g=0.070 g=0.68 \mathrm{~m} / \mathrm{s}^{2}
$$

The elevator $\left(m_{\mathrm{E}}\right)$ accelerates downward (and the counterweight $m_{\mathrm{C}}$ upward) at $a=0.070 g=0.68 \mathrm{~m} / \mathrm{s}^{2}$.
(b) The tension in the cable $F_{\mathrm{T}}$ can be obtained from either of the two
$\Sigma F=m a$ equations at the start of our solution, setting $a=0.070 g=0.68 \mathrm{~m} / \mathrm{s}^{2}$ :

$$
\begin{aligned}
F_{\mathrm{T}}=m_{\mathrm{E}} g-m_{\mathrm{E}} a & =m_{\mathrm{E}}(g-a) \\
& =1150 \mathrm{~kg}\left(9.80 \mathrm{~m} / \mathrm{s}^{2}-0.68 \mathrm{~m} / \mathrm{s}^{2}\right)=10,500 \mathrm{~N}
\end{aligned}
$$

or

$$
\begin{aligned}
F_{\mathrm{T}}=m_{\mathrm{C}} g+m_{\mathrm{C}} a & =m_{\mathrm{C}}(g+a) \\
& =1000 \mathrm{~kg}\left(9.80 \mathrm{~m} / \mathrm{s}^{2}+0.68 \mathrm{~m} / \mathrm{s}^{2}\right)=10,500 \mathrm{~N}
\end{aligned}
$$

which are consistent. As predicted, our result lies between 9800 N and 11,300 N. NOTE We can check our equation for the acceleration $a$ in this Example by noting that if the masses were equal $\left(m_{\mathrm{E}}=m_{\mathrm{C}}\right)$, then our equation above for $a$ would give $a=0$, as we should expect. Also, if one of the masses is zero (say, $\left.m_{\mathrm{C}}=0\right)$, then the other mass $\left(m_{\mathrm{E}} \neq 0\right)$ would be predicted by our equation to accelerate at $a=g$, again as expected.

(b)

CONCEPTUAL EXAMPLE 4-14 The advantage of a pulley. A mover is trying to lift a piano (slowly) up to a second-story apartment (Fig. 4-24). He is using a rope looped over two pulleys as shown. What force must he exert on the rope to slowly lift the piano's $1600-\mathrm{N}$ weight?

RESPONSE The magnitude of the tension force $F_{\mathrm{T}}$ within the rope is the same at any point along the rope if we assume we can ignore its mass. First notice the forces acting on the lower pulley at the piano. The weight of the piano (= mg) pulls down on the pulley. The tension in the rope, looped through this pulley, pulls up twice, once on each side of the pulley. Let us apply Newton's second law to the pulley-piano combination (of mass $m$ ), choosing the upward direction as positive:

$$
2 F_{\mathrm{T}}-m g=m a
$$

To move the piano with constant speed (set $a=0$ in this equation) thus requires a tension in the rope, and hence a pull on the rope, of $F_{\mathrm{T}}=m g / 2$. The piano mover can exert a force equal to half the piano's weight.
NOTE We say the pulley has given a mechanical advantage of 2, since without the pulley the mover would have to exert twice the force.

EXAMPLE 4-15 Accelerometer. A small mass $m$ hangs from a thin string and can swing like a pendulum. You attach it above the window of your car as shown in Fig. 4-25a. When the car is at rest, the string hangs vertically. What angle $\theta$ does the string make $(a)$ when the car accelerates at a constant $a=1.20 \mathrm{~m} / \mathrm{s}^{2}$, and $(b)$ when the car moves at constant velocity, $v=90 \mathrm{~km} / \mathrm{h}$ ?
APPROACH The free-body diagram of Fig. $4-25 \mathrm{~b}$ shows the pendulum at some angle $\theta$ relative to the vertical, and the forces on it: $m \overrightarrow{\mathbf{g}}$ downward, and the tension $\overrightarrow{\mathbf{F}}_{\mathrm{T}}$ in the cord (including its components). These forces do not add up to zero if $\theta \neq 0$; and since we have an acceleration $a$, we expect $\theta \neq 0$.
SOLUTION ( $a$ ) The acceleration $a=1.20 \mathrm{~m} / \mathrm{s}^{2}$ is horizontal ( $=a_{x}$ ), and the only horizontal force is the $x$ component of $\overrightarrow{\mathbf{F}}_{\mathrm{T}}, F_{\mathrm{T}} \sin \theta$ (Fig. 4-25b). Then from Newton's second law,

$$
m a=F_{\mathrm{T}} \sin \theta
$$

The vertical component of Newton's second law gives, since $a_{y}=0$,

$$
0=F_{\mathrm{T}} \cos \theta-m g
$$

So

$$
m g=F_{\mathrm{T}} \cos \theta
$$

Dividing these two equations, we obtain

$$
\tan \theta=\frac{F_{\mathrm{T}} \sin \theta}{F_{\mathrm{T}} \cos \theta}=\frac{m a}{m g}=\frac{a}{g}
$$

or

$$
\begin{aligned}
\tan \theta & =\frac{1.20 \mathrm{~m} / \mathrm{s}^{2}}{9.80 \mathrm{~m} / \mathrm{s}^{2}} \\
& =0.122
\end{aligned}
$$

so

$$
\theta=7.0^{\circ}
$$

(b) The velocity is constant, so $a=0$ and $\tan \theta=0$. Hence the pendulum hangs vertically $\left(\theta=0^{\circ}\right)$.
NOTE This simple device is an accelerometer-it can be used to determine acceleration, by mesuring the angle $\theta$.

## 4-8 Problems Involving Friction, Inclines

## Friction

Until now we have ignored friction, but it must be taken into account in most practical situations. Friction exists between two solid surfaces because even the smoothest looking surface is quite rough on a microscopic scale, Fig. 4-26. When we try to slide an object across a surface, these microscopic bumps impede the motion. Exactly what is happening at the microscopic level is not yet fully understood. It is thought that the atoms on a bump of one surface may come so close to the atoms of the other surface that attractive electric forces between the atoms could "bond" as a tiny weld between the two surfaces. Sliding an object across a surface is often jerky, perhaps due to the making and breaking of these bonds. Even when a round object rolls across a surface, there is still some friction, called rolling friction, although it is generally much less than when an object slides across a surface. We focus now on sliding friction, which is usually called kinetic friction (kinetic is from the Greek for "moving").

When an object slides along a rough surface, the force of kinetic friction acts opposite to the direction of the object's velocity. The magnitude of the force of kinetic friction depends on the nature of the two sliding surfaces. For given surfaces, experiment shows that the friction force is approximately proportional to the normal force between the two surfaces, which is the force that either object exerts on the other and is perpendicular to their common surface of contact (see Fig. 4-27). The force of friction between hard surfaces in many cases depends very little on the total surface area of contact; that is, the friction force on this book is roughly the same whether it is being slid across a table on its wide face or on its spine, assuming the surfaces have the same smoothness. We consider a simple model of friction in which we make this assumption that the friction force is independent of area. Then we write the proportionality between the magnitudes of the friction force $F_{\mathrm{fr}}$ and the normal force $F_{\mathrm{N}}$ as an equation by inserting a constant of proportionality, $\mu_{\mathrm{k}}$ :

$$
F_{\mathrm{fr}}=\mu_{\mathrm{k}} F_{\mathrm{N}}
$$

[kinetic friction]
This relation is not a fundamental law; it is an experimental relation between the magnitude of the friction force $F_{\mathrm{fr}}$, which acts parallel to the two surfaces, and the magnitude of the normal force $F_{\mathrm{N}}$, which acts perpendicular to the surfaces. It is not a vector equation since the two forces have different directions, perpendicular to one another. The term $\mu_{\mathrm{k}}$ is called the coefficient of kinetic friction, and its value depends on the nature of the two surfaces. Measured values for a variety of surfaces are given in Table 4-2. These are only approximate, however, since $\mu$ depends on whether the surfaces are wet or dry, on how much they have been sanded or rubbed, if any burrs remain, and other such factors. But $\mu_{\mathrm{k}}$ (which has no units) is roughly independent of the sliding speed, as well as the area in contact.

| TABLE 4-2 Coefficients of Friction ${ }^{\dagger}$ |  |  |
| :--- | :---: | :---: |
| Surfaces | Coefficient of <br> Static Friction, $\boldsymbol{\mu}_{\mathbf{s}}$ | Coefficient of <br> Kinetic Friction, $\boldsymbol{\mu}_{\mathbf{k}}$ |
| Wood on wood | 0.4 | 0.2 |
| Ice on ice | 0.1 | 0.03 |
| Metal on metal (lubricated) | 0.15 | 0.07 |
| Steel on steel (unlubricated) | 0.7 | 0.6 |

[^4]

FIGURE 4-26 An object moving to the right on a table. The two surfaces in contact are assumed smooth, but are rough on a microscopic scale.

FIGURE 4-27 When an object is pulled along a surface by an applied force $\left(\overrightarrow{\mathbf{F}}_{\mathrm{A}}\right)$, the force of friction $\overrightarrow{\mathbf{F}}_{\text {fr }}$ opposes the motion. The magnitude of $\overrightarrow{\mathbf{F}}_{\text {fr }}$ is proportional to the magnitude of the normal force $\left(F_{\mathrm{N}}\right)$.

CAUTION
$\overrightarrow{\vec{F}}_{\text {fr }} \perp \overrightarrow{\mathbf{F}}_{\mathrm{N}}$

FIGURE 4-27 Repeated for
Example 4-16.

FIGURE 4-28 Example 4-16.
Magnitude of the force of friction as a function of the external force applied to an object initially at rest. As the applied force is increased in magnitude, the force of static friction increases in proportion until the applied force equals $\mu_{\mathrm{s}} F_{\mathrm{N}}$. If the applied force increases further, the object will begin to move, and the friction force drops to a roughly constant value characteristic of kinetic friction.

What we have been discussing up to now is kinetic friction, when one object slides over another. There is also static friction, which refers to a force parallel to the two surfaces that can arise even when they are not sliding. Suppose an object such as a desk is resting on a horizontal floor. If no horizontal force is exerted on the desk, there also is no friction force. But now suppose you try to push the desk, and it doesn't move. You are exerting a horizontal force, but the desk isn't moving, so there must be another force on the desk keeping it from moving (the net force is zero on an object at rest). This is the force of static friction exerted by the floor on the desk. If you push with a greater force without moving the desk, the force of static friction also has increased. If you push hard enough, the desk will eventually start to move, and kinetic friction takes over. At this point, you have exceeded the maximum force of static friction, which is given by $\left(F_{f r}\right)_{\max }=\mu_{\mathrm{s}} F_{\mathrm{N}}$, where $\mu_{\mathrm{s}}$ is the coefficient of static friction (Table 4-2). Because the force of static friction can vary from zero to this maximum value, we write

$$
F_{\mathrm{fr}} \leq \mu_{\mathrm{s}} F_{\mathrm{N}}
$$

[static friction]
You may have noticed that it is often easier to keep a heavy object sliding than it is to start it sliding in the first place. This is consistent with $\mu_{\mathrm{s}}$ generally being greater than $\mu_{\mathrm{k}}$ (see Table 4-2).

EXAMPLE 4-16 Friction: static and kinetic. Our 10.0-kg mystery box rests on a horizontal floor. The coefficient of static friction is $\mu_{\mathrm{s}}=0.40$ and the coefficient of kinetic friction is $\mu_{\mathrm{k}}=0.30$. Determine the force of friction, $F_{\mathrm{fr}}$, acting on the box if a horizontal applied force $F_{\mathrm{A}}$ is exerted on it of magnitude: (a) 0 , (b) $10 \mathrm{~N},(c) 20 \mathrm{~N},(d) 38 \mathrm{~N}$, and (e) 40 N .

APPROACH We don't know, right off, if we are dealing with static friction or kinetic friction, nor if the box remains at rest or accelerates. We need to draw a free-body diagram, and then determine in each case whether or not the box will move: the box starts moving if $F_{\mathrm{A}}$ is greater than the maximum static friction force (Newton's second law). The forces on the box are gravity $m \overrightarrow{\mathbf{g}}$, the normal force exerted by the floor $\overrightarrow{\mathbf{F}}_{\mathrm{N}}$, the horizontal applied force $\overrightarrow{\mathbf{F}}_{\mathrm{A}}$, and the friction force $\overrightarrow{\mathbf{F}}_{\text {fr }}$, as shown in Fig. 4-27.
SOLUTION The free-body diagram of the box is shown in Fig. 4-27. In the vertical direction there is no motion, so Newton's second law in the vertical direction gives $\Sigma F_{y}=m a_{y}=0$, which tells us $F_{\mathrm{N}}-m g=0$. Hence the normal force is

$$
F_{\mathrm{N}}=m g=(10.0 \mathrm{~kg})\left(9.80 \mathrm{~m} / \mathrm{s}^{2}\right)=98.0 \mathrm{~N}
$$

(a) Because $F_{\mathrm{A}}=0$ in this first case, the box doesn't move, and $F_{\mathrm{fr}}=0$.
(b) The force of static friction will oppose any applied force up to a maximum of

$$
\mu_{\mathrm{s}} F_{\mathrm{N}}=(0.40)(98.0 \mathrm{~N})=39 \mathrm{~N}
$$

When the applied force is $F_{\mathrm{A}}=10 \mathrm{~N}$, the box will not move. Newton's second law gives $\Sigma F_{x}=F_{\mathrm{A}}-F_{\mathrm{fr}}=0$, so $F_{\mathrm{fr}}=10 \mathrm{~N}$.
(c) An applied force of 20 N is also not sufficient to move the box. Thus $F_{\mathrm{fr}}=20 \mathrm{~N}$ to balance the applied force.
(d) The applied force of 38 N is still not quite large enough to move the box; so the friction force has now increased to 38 N to keep the box at rest.
(e) A force of 40 N will start the box moving since it exceeds the maximum force of static friction, $\mu_{\mathrm{s}} F_{\mathrm{N}}=(0.40)(98 \mathrm{~N})=39 \mathrm{~N}$. Instead of static friction, we now have kinetic friction, and its magnitude is

$$
F_{\mathrm{fr}}=\mu_{\mathrm{k}} F_{\mathrm{N}}=(0.30)(98.0 \mathrm{~N})=29 \mathrm{~N}
$$

There is now a net (horizontal) force on the box of magnitude $F=40 \mathrm{~N}-29 \mathrm{~N}=11 \mathrm{~N}$, so the box will accelerate at a rate

$$
a_{x}=\frac{\Sigma F}{m}=\frac{11 \mathrm{~N}}{10.0 \mathrm{~kg}}=1.1 \mathrm{~m} / \mathrm{s}^{2}
$$

as long as the applied force is 40 N . Figure $4-28$ shows a graph that summarizes this Example.

Friction can be a hindrance. It slows down moving objects and causes heating and binding of moving parts in machinery. Friction can be reduced by using lubricants such as oil. More effective in reducing friction between two surfaces is to maintain a layer of air or other gas between them. Devices using this concept, which is not practical for most situations, include air tracks and air tables in which the layer of air is maintained by forcing air through many tiny holes. Another technique to maintain the air layer is to suspend objects in air using magnetic fields ("magnetic levitation").

On the other hand, friction can be helpful. Our ability to walk depends on friction between the soles of our shoes (or feet) and the ground. (Walking involves static friction, not kinetic friction. Why?) The movement of a car, and also its stability, depend on friction. When friction is low, such as on ice, safe walking or driving becomes difficult.

## CONCEPTUAL EXAMPLE 4-17 A box against a wall. You can hold a box

 against a rough wall (Fig. 4-29) and prevent it from slipping down by pressing hard horizontally. How does the application of a horizontal force keep an object from moving vertically?RESPONSE This won't work well if the wall is slippery. You need friction. Even then, if you don't press hard enough, the box will slip. The horizontal force you apply produces a normal force on the box exerted by the wall (the net force horizontally is zero since the box doesn't move horizontally). The force of gravity $m g$, acting downward on the box, can now be balanced by an upward static friction force whose maximum magnitude is proportional to the normal force. The harder you push, the greater $F_{\mathrm{N}}$ is and the greater $F_{\mathrm{fr}}$ can be. If you don't press hard enough, then $m g>\mu_{\mathrm{s}} F_{\mathrm{N}}$ and the box begins to slide down.

EXERCISE G If $\mu_{\mathrm{s}}=0.40$ and $m g=20 \mathrm{~N}$, what minimum force $F$ will keep the box from falling: (a) 100 N ; (b) 80 N ; (c) 50 N ; (d) 20 N ; (e) 8 N ?

EXAMPLE 4-18 Pulling against friction. A $10.0-\mathrm{kg}$ box is pulled along a horizontal surface by a force $F_{\mathrm{P}}$ of 40.0 N applied at a $30.0^{\circ}$ angle above horizontal. This is like Example 4-11 except now there is friction, and we assume a coefficient of kinetic friction of 0.30 . Calculate the acceleration.
APPROACH The free-body diagram is shown in Fig. 4-30. It is much like that in Fig. 4-21b, but with one more force, friction.
SOLUTION The calculation for the vertical $(y)$ direction is just the same as in Example $4-11 \mathrm{~b}, \quad m g=(10.0 \mathrm{~kg})\left(9.80 \mathrm{~m} / \mathrm{s}^{2}\right)=98.0 \mathrm{~N}$ and $F_{\mathrm{P} y}=$ $(40.0 \mathrm{~N})\left(\sin 30.0^{\circ}\right)=20.0 \mathrm{~N}$. With $y$ positive upward and $a_{y}=0$, we have

$$
\begin{aligned}
F_{\mathrm{N}}-m g+F_{\mathrm{P} y} & =m a_{y} \\
F_{\mathrm{N}}-98.0 \mathrm{~N}+20.0 \mathrm{~N} & =0,
\end{aligned}
$$

so the normal force is $F_{\mathrm{N}}=78.0 \mathrm{~N}$. Now we apply Newton's second law for the horizontal ( $x$ ) direction (positive to the right), and include the friction force:

$$
F_{\mathrm{P} x}-F_{\mathrm{fr}}=m a_{x} .
$$

The friction force is kinetic friction as long as $F_{\mathrm{fr}}=\mu_{\mathrm{k}} F_{\mathrm{N}}$ is less than $F_{\mathrm{P} x}=$ $(40.0 \mathrm{~N}) \cos 30.0^{\circ}=34.6 \mathrm{~N}$, which it is:

$$
F_{\mathrm{fr}}=\mu_{\mathrm{k}} F_{\mathrm{N}}=(0.30)(78.0 \mathrm{~N})=23.4 \mathrm{~N} .
$$

Hence the box does accelerate:

$$
a_{x}=\frac{F_{\mathrm{P} x}-F_{\mathrm{fr}}}{m}=\frac{34.6 \mathrm{~N}-23.4 \mathrm{~N}}{10.0 \mathrm{~kg}}=1.1 \mathrm{~m} / \mathrm{s}^{2} .
$$

In the absence of friction, as we saw in Example 4-11, the acceleration would be much greater than this.
NOTE Our final answer has only two significant figures because our least significant input value ( $\mu_{\mathrm{k}}=0.30$ ) has two.

## CAUTION

Tension in a cord supporting a falling object may not equal object's weight

CONCEPTUAL EXAMPLE 4-19 To push or to pull a sled? Your little sister wants a ride on her sled. If you are on flat ground, will you exert less force if you push her or pull her? See Figs. 4-31a and b. Assume the same angle $\theta$ in each case.

RESPONSE Let us draw free-body diagrams for the sled-sister combination, as shown in Figs. 4-31c and d. They show, for the two cases, the forces exerted by you, $\overrightarrow{\mathbf{F}}$ (an unknown), by the snow, $\overrightarrow{\mathbf{F}}_{\mathrm{N}}$ and $\overrightarrow{\mathbf{F}}_{\mathrm{fr}}$, and gravity $m \overrightarrow{\mathbf{g}}$. (a) If you push her, and $\theta>0$, there is a vertically downward component to your force. Hence the normal force upward exerted by the ground (Fig. 4-31c) will be larger than $m g$ (where $m$ is the mass of sister plus sled). (b) If you pull her, your force has a vertically upward component, so the normal force $F_{\mathrm{N}}$ will be less than $m g$, Fig. 4-31d. Because the friction force is proportional to the normal force, $F_{\text {fr }}$ will be less if you pull her. So you exert less force if you pull her.

EXAMPLE 4-20 Two boxes and a pulley. In Fig. 4-32a, two boxes are connected by a cord running over a pulley. The coefficient of kinetic friction between box A and the table is 0.20 . We ignore the mass of the cord and pulley and any friction in the pulley, which means we can assume that a force applied to one end of the cord will have the same magnitude at the other end. We wish to find the acceleration, $a$, of the system, which will have the same magnitude for both boxes assuming the cord doesn't stretch. As box B moves down, box A moves to the right.
APPROACH The free-body diagrams for each box are shown in Figs. 4-32b and c. The forces on box A are the pulling force of the $\operatorname{cord} F_{\mathrm{T}}$, gravity $m_{\mathrm{A}} g$, the normal force exerted by the table $F_{\mathrm{N}}$, and a friction force exerted by the table $F_{\mathrm{fr}}$; the forces on box B are gravity $m_{\mathrm{B}} g$, and the cord pulling up, $F_{\mathrm{T}}$.
SOLUTION Box A does not move vertically, so Newton's second law tells us the normal force just balances the weight,

$$
F_{\mathrm{N}}=m_{\mathrm{A}} g=(5.0 \mathrm{~kg})\left(9.8 \mathrm{~m} / \mathrm{s}^{2}\right)=49 \mathrm{~N} .
$$

In the horizontal direction, there are two forces on box A (Fig. 4-32b): $F_{\mathrm{T}}$, the tension in the cord (whose value we don't know), and the force of friction

$$
F_{\mathrm{fr}}=\mu_{\mathrm{k}} F_{\mathrm{N}}=(0.20)(49 \mathrm{~N})=9.8 \mathrm{~N} .
$$

The horizontal acceleration (box A) is what we wish to find; we use Newton's second law in the $x$ direction, $\Sigma F_{\mathrm{A} x}=m_{\mathrm{A}} a_{x}$, which becomes (taking the positive direction to the right and setting $a_{\mathrm{A} x}=a$ ):

$$
\begin{equation*}
\Sigma F_{\mathrm{A} x}=F_{\mathrm{T}}-F_{\mathrm{fr}}=m_{\mathrm{A}} a \tag{boxA}
\end{equation*}
$$

Next consider box B. The force of gravity $m_{\mathrm{B}} g=(2.0 \mathrm{~kg})\left(9.8 \mathrm{~m} / \mathrm{s}^{2}\right)=19.6 \mathrm{~N}$ pulls downward; and the cord pulls upward with a force $F_{\mathrm{T}}$. So we can write Newton's second law for box B (taking the downward direction as positive):

$$
\begin{equation*}
\Sigma F_{\mathrm{B} y}=m_{\mathrm{B}} g-F_{\mathrm{T}}=m_{\mathrm{B}} a . \tag{boxB}
\end{equation*}
$$

[Notice that if $a \neq 0$, then $F_{\mathrm{T}}$ is not equal to $m_{\mathrm{B}} g$.]
We have two unknowns, $a$ and $F_{\mathrm{T}}$, and we also have two equations. We solve the box A equation for $F_{\mathrm{T}}$ :

$$
F_{\mathrm{T}}=F_{\mathrm{fr}}+m_{\mathrm{A}} a,
$$

and substitute this into the box B equation:

$$
m_{\mathrm{B}} g-F_{\mathrm{fr}}-m_{\mathrm{A}} a=m_{\mathrm{B}} a .
$$

Now we solve for $a$ and put in numerical values:

$$
a=\frac{m_{\mathrm{B}} g-F_{\mathrm{fr}}}{m_{\mathrm{A}}+m_{\mathrm{B}}}=\frac{19.6 \mathrm{~N}-9.8 \mathrm{~N}}{5.0 \mathrm{~kg}+2.0 \mathrm{~kg}}=1.4 \mathrm{~m} / \mathrm{s}^{2},
$$

which is the acceleration of box A to the right, and of box B down.
If we wish, we can calculate $F_{\mathrm{T}}$ using the third equation up from here:

$$
F_{\mathrm{T}}=F_{\mathrm{fr}}+m_{\mathrm{A}} a=9.8 \mathrm{~N}+(5.0 \mathrm{~kg})\left(1.4 \mathrm{~m} / \mathrm{s}^{2}\right)=17 \mathrm{~N} .
$$

NOTE Box B is not in free fall. It does not fall at $a=g$ because an additional force, $F_{\mathrm{T}}$, is acting upward on it.

## Inclines

Now we consider what happens when an object slides down an incline, such as a hill or ramp. Such problems are interesting because gravity is the accelerating force, yet the acceleration is not vertical. Solving problems is usually easier if we choose the $x y$ coordinate system so the $x$ axis points along the incline (the direction of motion) and the $y$ axis is perpendicular to the incline, as shown in Fig. 4-33. Note also that the normal force is not vertical, but is perpendicular to the sloping surface of the plane, along the $y$ axis in Fig. 4-33.
EXERCISE H Is the normal force always perpendicular to an inclined plane? Is it always vertical?

EXAMPLE 4-21 The skier. The skier in Fig. 4-34a has begun descending the $30^{\circ}$ slope. If the coefficient of kinetic friction is 0.10 , what is her acceleration? APPROACH We choose the $x$ axis along the slope, positive downslope in the direction of the skier's motion. The $y$ axis is perpendicular to the surface. The forces acting on the skier are gravity, $\overrightarrow{\mathbf{F}}_{\mathrm{G}}=m \overrightarrow{\mathbf{g}}$, which points vertically downward (not perpendicular to the slope), and the two forces exerted on her skis by the snow-the normal force perpendicular to the snowy slope (not vertical), and the friction force parallel to the surface. These three forces are shown acting at one point in Fig. 4-34b, which is our free-body diagram for the skier.
SOLUTION We have to resolve only one vector into components, the weight $\overrightarrow{\mathbf{F}}_{\mathrm{G}}$, and its components are shown as dashed lines in Fig. 4-34c. To be general, we use $\theta$ rather than $30^{\circ}$ for now. We use the definitions of sine ("side opposite") and cosine ("side adjacent") to obtain the components:

$$
\begin{aligned}
& F_{\mathrm{G} x}=m g \sin \theta \\
& F_{\mathrm{G} y}=-m g \cos \theta
\end{aligned}
$$

where $F_{\mathrm{G} y}$ is in the negative $y$ direction. To calculate the skier's acceleration down the hill, $a_{x}$, we apply Newton's second law to the $x$ direction:

$$
\begin{aligned}
\Sigma F_{x} & =m a_{x} \\
m g \sin \theta-\mu_{\mathrm{k}} F_{\mathrm{N}} & =m a_{x}
\end{aligned}
$$

where the two forces are the $x$ component of the gravity force ( $+x$ direction) and the friction force ( $-x$ direction). We want to find the value of $a_{x}$, but we don't yet know $F_{\mathrm{N}}$ in the last equation. Let's see if we can get $F_{\mathrm{N}}$ from the $y$ component of Newton's second law:

$$
\begin{aligned}
\Sigma F_{y} & =m a_{y} \\
F_{\mathrm{N}}-m g \cos \theta & =m a_{y}=0
\end{aligned}
$$

where we set $a_{y}=0$ because there is no motion in the $y$ direction (perpendicular to the slope). Thus we can solve for $F_{\mathrm{N}}$ :

$$
F_{\mathrm{N}}=m g \cos \theta
$$

and we can substitute this into our equation above for $m a_{x}$ :

$$
m g \sin \theta-\mu_{\mathrm{k}}(m g \cos \theta)=m a_{x}
$$

There is an $m$ in each term which can be canceled out. Thus (setting $\theta=30^{\circ}$ and $\mu_{\mathrm{k}}=0.10$ ):

$$
\begin{aligned}
a_{x} & =g \sin 30^{\circ}-\mu_{\mathrm{k}} g \cos 30^{\circ} \\
& =0.50 g-(0.10)(0.866) g=0.41 g
\end{aligned}
$$

The skier's acceleration is 0.41 times the acceleration of gravity, which in numbers ${ }^{\dagger}$ is $a=(0.41)\left(9.8 \mathrm{~m} / \mathrm{s}^{2}\right)=4.0 \mathrm{~m} / \mathrm{s}^{2}$.
NOTE The mass canceled out, so we have the useful conclusion that the acceleration doesn't depend on the mass. That such a cancellation sometimes occurs, and thus may give a useful conclusion as well as saving calculation, is a big advantage of working with the algebraic equations and putting in the numbers only at the end.

[^5]

FIGURE 4-33 Forces on an object sliding down an incline.

## (8) $\underset{\text { Skiing }}{\text { PICSAPPLIED }}$

FIGURE 4-34 Example 4-21. Skier descending a slope; $\overrightarrow{\mathbf{F}}_{\mathrm{G}}=m \overrightarrow{\mathbf{g}}$ is the force of gravity (weight) on the skier.

(a)

(c)

PROBLEM SOLVING It is often helpful to put in numbers only at the end

Directions of gravity and the normal force

In Problems involving a slope or an "inclined plane," avoid making errors in the directions of the normal force and gravity. The normal force on an incline is not vertical: it is perpendicular to the slope or plane. And gravity is not perpendicular to the slope-gravity acts vertically downward toward the center of the Earth.

## Summary

Newton's three laws of motion are the basic classical laws describing motion.

Newton's first law (the law of inertia) states that if the net force on an object is zero, an object originally at rest remains at rest, and an object in motion remains in motion in a straight line with constant velocity.

Newton's second law states that the acceleration of an object is directly proportional to the net force acting on it, and inversely proportional to its mass:

$$
\begin{equation*}
\Sigma \overrightarrow{\mathbf{F}}=m \overrightarrow{\mathbf{a}} \tag{4-1}
\end{equation*}
$$

Newton's second law is one of the most important and fundamental laws in classical physics.

Newton's third law states that whenever one object exerts a force on a second object, the second object always exerts a force on the first object which is equal in magnitude but opposite in direction:

$$
\begin{equation*}
\overrightarrow{\mathbf{F}}_{\mathrm{AB}}=-\overrightarrow{\mathbf{F}}_{\mathrm{BA}} \tag{4-2}
\end{equation*}
$$

where $\overrightarrow{\mathbf{F}}_{\mathrm{BA}}$ is the force on object B exerted by object A .
The tendency of an object to resist a change in its motion is called inertia. Mass is a measure of the inertia of an object.

Weight refers to the gravitational force on an object, and is equal to the product of the object's mass $m$ and the acceleration of gravity $\overrightarrow{\mathbf{g}}$ :

$$
\begin{equation*}
\overrightarrow{\mathbf{F}}_{\mathrm{G}}=m \overrightarrow{\mathbf{g}} . \tag{4-3}
\end{equation*}
$$

Force, which is a vector, can be considered as a push or pull; or, from Newton's second law, force can be defined as an action capable of giving rise to acceleration. The net force on an object is the vector sum of all forces acting on that object.

When two objects slide over one another, the force of friction that each object exerts on the other can be written approximately as $F_{\mathrm{fr}}=\mu_{\mathrm{k}} F_{\mathrm{N}}$, where $F_{\mathrm{N}}$ is the normal force (the force each object exerts on the other perpendicular to their contact surfaces), and $\mu_{\mathrm{k}}$ is the coefficient of kinetic friction. If the objects are at rest relative to each other, then $F_{\text {fr }}$ is just large enough to hold them at rest and satisfies the inequality $F_{\mathrm{fr}}<\mu_{\mathrm{s}} F_{\mathrm{N}}$, where $\mu_{\mathrm{s}}$ is the coefficient of static friction.

For solving problems involving the forces on one or more objects, it is essential to draw a free-body diagram for each object, showing all the forces acting on only that object. Newton's second law can be applied to the vector components for each object.

## Questions

1. Why does a child in a wagon seem to fall backward when you give the wagon a sharp pull forward?
2. A box rests on the (frictionless) bed of a truck. The truck driver starts the truck and accelerates forward. The box immediately starts to slide toward the rear of the truck bed. Discuss the motion of the box, in terms of Newton's laws, as seen (a) by Mary standing on the ground beside the truck, and (b) by Chris who is riding on the truck (Fig. 4-35).

3. If an object is moving, is it possible for the net force acting on it to be zero? Explain.
4. If the acceleration of an object is zero, are no forces acting on it? Explain.
5. Only one force acts on an object. Can the object have zero acceleration? Can it have zero velocity? Explain.
6. When a golf ball is dropped to the pavement, it bounces back up. (a) Is a force needed to make it bounce back up? (b) If so, what exerts the force?
7. If you walk along a log floating on a lake, why does the log move in the opposite direction?
8. (a) Why do you push down harder on the pedals of a bicycle when first starting out than when moving at constant speed? (b) Why do you need to pedal at all when cycling at constant speed?
9. A stone hangs by a fine thread from the ceiling, and a section of the same thread dangles from the bottom of the stone (Fig. 4-36). If a person gives a sharp pull on the dangling thread, where is the thread likely to break: below the stone or above it? What if the person gives a slow and steady pull? Explain your answers.

FIGURE 4-36
Question 9.

10. The force of gravity on a $2-\mathrm{kg}$ rock is twice as great as that on a $1-\mathrm{kg}$ rock. Why then doesn't the heavier rock fall faster?
11. (a) You pull a box with a constant force across a frictionless table using an attached rope held horizontally. If you now pull the rope with the same force at an angle to the horizontal (with the box remaining flat on the table), does the acceleration of the box increase, decrease, or remain the same? Explain. (b) What if there is friction?
12. When an object falls freely under the influence of gravity there is a net force $m g$ exerted on it by the Earth. Yet by Newton's third law the object exerts an equal and opposite force on the Earth. Does the Earth move? Explain.
13. Compare the effort (or force) needed to lift a $10-\mathrm{kg}$ object when you are on the Moon with the force needed to lift it on Earth. Compare the force needed to throw a 2-kg object horizontally with a given speed on the Moon and on Earth.
14. According to Newton's third law, each team in a tug of war (Fig. 4-37) pulls with equal force on the other team. What, then, determines which team will win?

FIGURE 4-37 Question 14. A tug of war. Describe the forces on each of the teams and on the rope.
15. When you stand still on the ground, how large a force does the ground exert on you? Why doesn't this force make you rise up into the air?
16. Whiplash sometimes results from an automobile accident when the victim's car is struck violently from the rear. Explain why the head of the victim seems to be thrown backward in this situation. Is it really?
17. Mary exerts an upward force of 40 N to hold a bag of groceries. Describe the "reaction" force (Newton's third law) by stating (a) its magnitude, (b) its direction, (c) on what object it is exerted, and ( $d$ ) by what object it is exerted.
18. A father and his young daughter are ice skating. They face each other at rest and push each other, moving in opposite directions. Which one has the greater final speed? Explain.
19. A heavy crate rests on the bed of a flatbed truck. When the truck accelerates, the crate stays fixed on the truck, so it, too, accelerates. What force causes the crate to accelerate?
20. A block is given a brief push so that it slides up a ramp. After the block reaches its highest point, it slides back down, but the magnitude of its acceleration is less on the descent than on the ascent. Why?
21. Why is the stopping distance of a truck much shorter than for a train going the same speed?
22. What would your bathroom scale read if you weighed yourself on an inclined plane? Assume the mechanism functions properly, even at an angle.

## MisConceptual Questions

1. A truck is traveling horizontally to the right (Fig. 4-38). When the truck starts to slow down, the crate on the (frictionless) truck bed starts to slide. In what direction could the net force be on the crate?
(a) No direction. The net force is zero.
(b) Straight down (because of gravity).
(c) Straight up (the normal force).
(d) Horizontal and to the right.
(e) Horizontal and to the left.

FIGURE 4-38
MisConceptual Question 1.
2. You are trying to push your stalled car. Although you apply a horizontal force of 400 N to the car, it doesn't budge, and neither do you. Which force(s) must also have a magnitude of 400 N ?
(a) The force exerted by the car on you.
(b) The friction force exerted by the car on the road.
(c) The normal force exerted by the road on you.
(d) The friction force exerted by the road on you.
3. Matt, in the foreground of Fig. 4-39, is able to move the large truck because
(a) he is stronger than the truck.
(b) he is heavier in some respects than the truck.
(c) he exerts a greater force on the truck than the truck exerts back on him.
(d) the ground exerts a greater friction force on Matt than it does on the truck.
(e) the truck offers no resistance because its brakes are off.

FIGURE 4-39 MisConceptual Question 3.
4. A bear sling, Fig. 4-40, is used in some national parks for placing backpackers' food out of the reach of bears. As the backpacker raises the pack by pulling down on the rope, the force $F$ needed:
(a) decreases as the pack rises until the rope is straight across.
(b) doesn't change.
(c) increases until the rope is straight.
(d) increases but the rope always sags where the pack hangs.

FIGURE 4-40
MisConceptual Question 4.

5. What causes the boat in Fig. 4-41 to move forward?
(a) The force the man exerts on the paddle.
(b) The force the paddle exerts on the water.
(c) The force the water exerts on the paddle.
(d) The motion of the water itself.

FIGURE 4-41 MisConceptual Question 5.
6. A person stands on a scale in an elevator. His apparent weight will be the greatest when the elevator
(a) is standing still.
(b) is moving upward at constant velocity.
(c) is accelerating upward.
(d) is moving downward at constant velocity.
$(e)$ is accelerating downward.
7. When a skier skis down a hill, the normal force exerted on the skier by the hill is
(a) equal to the weight of the skier.
(b) greater than the weight of the skier.
(c) less than the weight of the skier.
8. A golf ball is hit with a golf club. While the ball flies through the air, which forces act on the ball? Neglect air resistance.
(a) The force of the golf club acting on the ball.
(b) The force of gravity acting on the ball.
(c) The force of the ball moving forward through the air.
(d) All of the above.
(e) Both (a) and (c).
9. Suppose an object is accelerated by a force of 100 N. Suddenly a second force of 100 N in the opposite direction is exerted on the object, so that the forces cancel. The object
(a) is brought to rest rapidly.
(b) decelerates gradually to rest.
(c) continues at the velocity it had before the second force was applied.
(d) is brought to rest and then accelerates in the direction of the second force.
10. You are pushing a heavy box across a rough floor. When you are initially pushing the box and it is accelerating,
(a) you exert a force on the box, but the box does not exert a force on you.
(b) the box is so heavy it exerts a force on you, but you do not exert a force on the box.
(c) the force you exert on the box is greater than the force of the box pushing back on you.
(d) the force you exert on the box is equal to the force of the box pushing back on you.
(e) the force that the box exerts on you is greater than the force you exert on the box.
11. A $50-\mathrm{N}$ crate sits on a horizontal floor where the coefficient of static friction between the crate and the floor is 0.50 . A $20-\mathrm{N}$ force is applied to the crate acting to the right. What is the resulting static friction force acting on the crate?
(a) 20 N to the right.
(b) 20 N to the left.
(c) 25 N to the right.
(d) 25 N to the left.
(e) None of the above; the crate starts to move.
12. The normal force on an extreme skier descending a very steep slope (Fig. 4-42) can be zero if
(a) his speed is great enough.
(b) he leaves the slope (no longer touches the snow).
(c) the slope is greater than $75^{\circ}$.
(d) the slope is vertical $\left(90^{\circ}\right)$.

FIGURE 4-42 MisConceptual Question 12.
13. To pull an old stump out of the ground, you and a friend tie two ropes to the stump. You pull on it with a force of 500 N to the north while your friend pulls with a force of 450 N to the northwest. The total force from the two ropes is
(a) less than 950 N .
(b) exactly 950 N .
(c) more than 950 N .

Problems
[It would be wise, before starting the Problems, to reread the Problem Solving Strategies on pages 30, 60, and 88.]

## 4-4 to 4-6 Newton's Laws, Gravitational Force, Normal Force [Assume no friction.]

1. (I) What force is needed to accelerate a sled (mass $=55 \mathrm{~kg}$ ) at $1.4 \mathrm{~m} / \mathrm{s}^{2}$ on horizontal frictionless ice?
2. (I) What is the weight of a $68-\mathrm{kg}$ astronaut (a) on Earth, (b) on the Moon $\left(g=1.7 \mathrm{~m} / \mathrm{s}^{2}\right)$, $(c)$ on Mars $\left(g=3.7 \mathrm{~m} / \mathrm{s}^{2}\right)$,
(d) in outer space traveling with constant velocity?
3. (I) How much tension must a rope withstand if it is used to accelerate a $1210-\mathrm{kg}$ car horizontally along a frictionless surface at $1.20 \mathrm{~m} / \mathrm{s}^{2}$ ?
4. (II) According to a simplified model of a mammalian heart, at each pulse approximately 20 g of blood is accelerated from $0.25 \mathrm{~m} / \mathrm{s}$ to $0.35 \mathrm{~m} / \mathrm{s}$ during a period of 0.10 s . What is the magnitude of the force exerted by the heart muscle?
5. (II) Superman must stop a $120-\mathrm{km} / \mathrm{h}$ train in 150 m to keep it from hitting a stalled car on the tracks. If the train's mass is $3.6 \times 10^{5} \mathrm{~kg}$, how much force must he exert? Compare to the weight of the train (give as \%). How much force does the train exert on Superman?
6. (II) A person has a reasonable chance of surviving an automobile crash if the deceleration is no more than 30 g 's. Calculate the force on a $65-\mathrm{kg}$ person accelerating at this rate. What distance is traveled if brought to rest at this rate from $95 \mathrm{~km} / \mathrm{h}$ ?
7. (II) What average force is required to stop a $950-\mathrm{kg}$ car in 8.0 s if the car is traveling at $95 \mathrm{~km} / \mathrm{h}$ ?
8. (II) Estimate the average force exerted by a shot-putter on a $7.0-\mathrm{kg}$ shot if the shot is moved through a distance of 2.8 m and is released with a speed of $13 \mathrm{~m} / \mathrm{s}$.
9. (II) A $0.140-\mathrm{kg}$ baseball traveling $35.0 \mathrm{~m} / \mathrm{s}$ strikes the catcher's mitt, which, in bringing the ball to rest, recoils backward 11.0 cm . What was the average force applied by the ball on the glove?
10. (II) How much tension must a cable withstand if it is used to accelerate a $1200-\mathrm{kg}$ car vertically upward at $0.70 \mathrm{~m} / \mathrm{s}^{2}$ ?
11. (II) A $20.0-\mathrm{kg}$ box rests on a table. (a) What is the weight of the box and the normal force acting on it? (b) A $10.0-\mathrm{kg}$ box is placed on top of the $20.0-\mathrm{kg}$ box, as shown in Fig. 4-43. Determine the normal force that the table exerts on the $20.0-\mathrm{kg}$ box and the normal force that the $20.0-\mathrm{kg}$ box exerts on the $10.0-\mathrm{kg}$ box.

FIGURE 4-43 Problem 11.
12. (II) A $14.0-\mathrm{kg}$ bucket is lowered vertically by a rope in which there is 163 N of tension at a given instant. What is the acceleration of the bucket? Is it up or down?
13. (II) A $75-\mathrm{kg}$ petty thief wants to escape from a third-story jail window. Unfortunately, a makeshift rope made of sheets tied together can support a mass of only 58 kg . How might the thief use this "rope" to escape? Give a quantitative answer.
14. (II) An elevator (mass 4850 kg ) is to be designed so that the maximum acceleration is 0.0680 g . What are the maximum and minimum forces the motor should exert on the supporting cable?
15. (II) Can cars "stop on a dime"? Calculate the acceleration of a $1400-\mathrm{kg}$ car if it can stop from $35 \mathrm{~km} / \mathrm{h}$ on a dime $($ diameter $=1.7 \mathrm{~cm})$. How many $g$ 's is this? What is the force felt by the $68-\mathrm{kg}$ occupant of the car?
16. (II) A woman stands on a bathroom scale in a motionless elevator. When the elevator begins to move, the scale briefly reads only 0.75 of her regular weight. Calculate the acceleration of the elevator, and find the direction of acceleration.
17. (II) (a) What is the acceleration of two falling sky divers (total mass $=132 \mathrm{~kg}$ including parachute) when the upward force of air resistance is equal to one-fourth of their weight? (b) After opening the parachute, the divers descend leisurely to the ground at constant speed. What now is the force of air resistance on the sky divers and their parachute? See Fig. 4-44.

FIGURE 4-44
Problem 17.
18. (II) The cable supporting a $2125-\mathrm{kg}$ elevator has a maximum strength of $21,750 \mathrm{~N}$. What maximum upward acceleration can it give the elevator without breaking?
19. (III) A person jumps from the roof of a house 2.8 m high. When he strikes the ground below, he bends his knees so that his torso decelerates over an approximate distance of 0.70 m . If the mass of his torso (excluding legs) is 42 kg , find (a) his velocity just before his feet strike the ground, and (b) the average force exerted on his torso by his legs during deceleration.

## 4-7 Newton's Laws and Vectors [Ignore friction.]

20. (I) A box weighing 77.0 N rests on a table. A rope tied to the box runs vertically upward over a pulley and a weight is hung from the other end (Fig. 4-45). Determine the force that the table exerts on the box if the weight hanging on the other side of the pulley weighs (a) 30.0 N , (b) 60.0 N , and (c) 90.0 N .

FIGURE 4-45 Problem 20.

21. (I) Draw the free-body diagram for a basketball player (a) just before leaving the ground on a jump, and $(b)$ while in the air. See Fig. 4-46.

FIGURE 4-46
Problem 21.

22. (I) Sketch the free-body diagram of a baseball (a) at the moment it is hit by the bat, and again (b) after it has left the bat and is flying toward the outfield. Ignore air resistance.
23. (II) Arlene is to walk across a "high wire" strung horizontally between two buildings 10.0 m apart. The sag in the rope when she is at the midpoint is $10.0^{\circ}$, as shown in Fig. 4-47. If her mass is 50.0 kg , what is the tension in the rope at this point?

FIGURE 4-47 Problem 23.
24. (II) A window washer pulls herself upward using the bucket-pulley apparatus shown in Fig. 4-48. (a) How hard must she pull downward to raise herself slowly at constant speed? (b) If she increases this force by $15 \%$, what will her acceleration be? The mass of the person plus the bucket is 72 kg .

FIGURE 4-48
Problem 24.

25. (II) One 3.2-kg paint bucket is hanging by a massless cord from another $3.2-\mathrm{kg}$ paint bucket, also hanging by a massless cord, as shown in Fig. 4-49. (a) If the buckets are at rest, what is the tension in each cord? (b) If the two buckets are pulled upward with an acceleration of $1.25 \mathrm{~m} / \mathrm{s}^{2}$ by the upper cord, calculate the tension in each cord.

FIGURE 4-49
Problem 25.
26. (II) Two snowcats in Antarctica are towing a housing unit north, as shown in Fig. 4-50. The sum of the forces $\overrightarrow{\mathbf{F}}_{\mathrm{A}}$ and $\overrightarrow{\mathbf{F}}_{\mathrm{B}}$ exerted on the unit by the horizontal cables is north, parallel to the line L , and $F_{\mathrm{A}}=4500 \mathrm{~N}$. Determine $F_{\mathrm{B}}$ and the magnitude of $\overrightarrow{\mathbf{F}}_{\mathrm{A}}+\overrightarrow{\mathbf{F}}_{\mathrm{B}}$.

FIGURE 4-50
Problem 26.

27. (II) A train locomotive is pulling two cars of the same mass behind it, Fig. 4-51. Determine the ratio of the tension in the coupling (think of it as a cord) between the locomotive and the first car $\left(F_{\mathrm{T} 1}\right)$, to that between the first car and the second car $\left(F_{\mathrm{T} 2}\right)$, for any nonzero acceleration of the train.

FIGURE 4-51 Problem 27.
28. (II) The two forces $\overrightarrow{\mathbf{F}}_{1}$ and $\overrightarrow{\mathbf{F}}_{2}$ shown in Fig. 4-52a and b (looking down) act on an $18.5-\mathrm{kg}$ object on a frictionless tabletop. If $F_{1}=10.2 \mathrm{~N}$ and $F_{2}=16.0 \mathrm{~N}$, find the net force on the object and its acceleration for (a) and (b).

FIGURE 4-52 Problem 28.
29. (II) At the instant a race began, a $65-\mathrm{kg}$ sprinter exerted a force of 720 N on the starting block at a $22^{\circ}$ angle with respect to the ground. (a) What was the horizontal acceleration of the sprinter? (b) If the force was exerted for 0.32 s , with what speed did the sprinter leave the starting block?
30. (II) A $27-\mathrm{kg}$ chandelier hangs from a ceiling on a vertical 4.0-m-long wire. (a) What horizontal force would be necessary to displace its position 0.15 m to one side? (b) What will be the tension in the wire?
31. (II) An object is hanging by a string from your rearview mirror. While you are decelerating at a constant rate from $25 \mathrm{~m} / \mathrm{s}$ to rest in $6.0 \mathrm{~s},(a)$ what angle does the string make with the vertical, and (b) is it toward the windshield or away from it? [Hint: See Example 4-15.]
32. (II) Figure $4-53$ shows a block (mass $m_{\mathrm{A}}$ ) on a smooth horizontal surface, connected by a thin cord that passes over a pulley to a second block $\left(m_{\mathrm{B}}\right)$, which hangs vertically. (a) Draw a free-body diagram for each block, showing the force of gravity on each, the force (tension) exerted by the cord, and any normal force. (b) Apply Newton's second law to find formulas for the acceleration of the system and for the tension in the cord. Ignore friction and the masses of the pulley and cord.

FIGURE 4-53
Problems 32 and 33.
Mass $m_{\mathrm{A}}$ rests on a smooth horizontal surface; $m_{\mathrm{B}}$ hangs vertically.

33. (II) (a) If $m_{\mathrm{A}}=13.0 \mathrm{~kg}$ and $m_{\mathrm{B}}=5.0 \mathrm{~kg}$ in Fig. $4-53$, determine the acceleration of each block. (b) If initially $m_{\mathrm{A}}$ is at rest 1.250 m from the edge of the table, how long does it take to reach the edge of the table if the system is allowed to move freely? (c) If $m_{\mathrm{B}}=1.0 \mathrm{~kg}$, how large must $m_{\mathrm{A}}$ be if the acceleration of the system is to be kept at $\frac{1}{100} g$ ?
34. (III) Three blocks on a frictionless horizontal surface are in contact with each other as shown in Fig. 4-54. A force $\overrightarrow{\mathbf{F}}$ is applied to block A (mass $m_{\mathrm{A}}$ ). (a) Draw a free-body diagram for each block. Determine (b) the acceleration of the system (in terms of $m_{\mathrm{A}}, m_{\mathrm{B}}$, and $m_{\mathrm{C}}$ ), (c) the net force on each block, and $(d)$ the force of contact that each block exerts on its neighbor. (e) If $m_{\mathrm{A}}=m_{\mathrm{B}}=m_{\mathrm{C}}=10.0 \mathrm{~kg}$ and $F=96.0 \mathrm{~N}$, give numerical answers to (b), (c), and (d). Explain how your answers make sense intuitively.

FIGURE 4-54
Problem 34.
35. (III) Suppose the pulley in Fig. $4-55$ is suspended by a cord C. Determine the tension in this cord after the masses are released and before one hits the ground. Ignore the mass of the pulley and cords.

FIGURE 4-55
Problem 35.

## 4-8 Newton's Laws with Friction, Inclines

36. (I) If the coefficient of kinetic friction between a $22-\mathrm{kg}$ crate and the floor is 0.30 , what horizontal force is required to move the crate at a steady speed across the floor? What horizontal force is required if $\mu_{\mathrm{k}}$ is zero?
37. (I) A force of 35.0 N is required to start a $6.0-\mathrm{kg}$ box moving across a horizontal concrete floor. (a) What is the coefficient of static friction between the box and the floor? (b) If the $35.0-\mathrm{N}$ force continues, the box accelerates at $0.60 \mathrm{~m} / \mathrm{s}^{2}$. What is the coefficient of kinetic friction?
38. (I) Suppose you are standing on a train accelerating at 0.20 g . What minimum coefficient of static friction must exist between your feet and the floor if you are not to slide?
39. (II) The coefficient of static friction between hard rubber and normal street pavement is about 0.90 . On how steep a hill (maximum angle) can you leave a car parked?
40. (II) A flatbed truck is carrying a heavy crate. The coefficient of static friction between the crate and the bed of the truck is 0.75 . What is the maximum rate at which the driver can decelerate and still avoid having the crate slide against the cab of the truck?
41. (II) A $2.0-\mathrm{kg}$ silverware drawer does not slide readily. The owner gradually pulls with more and more force, and when the applied force reaches 9.0 N , the drawer suddenly opens, throwing all the utensils to the floor. What is the coefficient of static friction between the drawer and the cabinet?
42. (II) A box is given a push so that it slides across the floor. How far will it go, given that the coefficient of kinetic friction is 0.15 and the push imparts an initial speed of $3.5 \mathrm{~m} / \mathrm{s}$ ?
43. (II) A $1280-\mathrm{kg}$ car pulls a $350-\mathrm{kg}$ trailer. The car exerts a horizontal force of $3.6 \times 10^{3} \mathrm{~N}$ against the ground in order to accelerate. What force does the car exert on the trailer? Assume an effective friction coefficient of 0.15 for the trailer.
44. (II) Police investigators, examining the scene of an accident involving two cars, measure $72-\mathrm{m}$-long skid marks of one of the cars, which nearly came to a stop before colliding. The coefficient of kinetic friction between rubber and the pavement is about 0.80 . Estimate the initial speed of that car assuming a level road.
45. (II) Drag-race tires in contact with an asphalt surface have a very high coefficient of static friction. Assuming a constant acceleration and no slipping of tires, estimate the coefficient of static friction needed for a drag racer to cover 1.0 km in 12 s , starting from rest.
46. (II) For the system of Fig. 4-32 (Example 4-20), how large a mass would box A have to have to prevent any motion from occurring? Assume $\mu_{\mathrm{S}}=0.30$.
47. (II) In Fig. 4-56 the coefficient of static friction between mass $m_{\mathrm{A}}$ and the table is 0.40 , whereas the coefficient of kinetic friction is 0.20 .
(a) What minimum value of $m_{\mathrm{A}}$ will keep the system from starting to move? (b) What value(s) of $m_{\mathrm{A}}$ will keep the system moving at constant speed?
[Ignore masses of the cord and the

FIGURE 4-56
Problem 47.
48. (II) A small box is held in place against a rough vertical wall by someone pushing on it with a force directed upward at $28^{\circ}$ above the horizontal. The coefficients of static and kinetic friction between the box and wall are 0.40 and 0.30 , respectively. The box slides down unless the applied force has magnitude 23 N . What is the mass of the box?
49. (II) Two crates, of mass 65 kg and 125 kg , are in contact and at rest on a horizontal surface (Fig. 4-57). A 650-N force is exerted on the $65-\mathrm{kg}$ crate. If the coefficient of kinetic friction is 0.18 , calculate (a) the acceleration of the system, and (b) the force that each crate exerts on the other. (c) Repeat with the crates reversed.

## FIGURE 4-57

Problem 49.
50. (II) A person pushes a $14.0-\mathrm{kg}$ lawn mower at constant speed with a force of $F=88.0 \mathrm{~N}$ directed along the handle, which is at an angle of $45.0^{\circ}$ to the horizontal (Fig. 4-58). (a) Draw the free-body diagram showing all forces acting on the mower. Calculate $(b)$ the horizontal friction force on the mower, then $(c)$ the normal force exerted vertically upward on the mower by the ground. (d) What force must the person exert on the lawn mower to accelerate it from rest to $1.5 \mathrm{~m} / \mathrm{s}$ in 2.5 seconds, assuming the same friction force?

FIGURE 4-58
Problem 50.

51. (II) A child on a sled reaches the bottom of a hill with a velocity of $10.0 \mathrm{~m} / \mathrm{s}$ and travels 25.0 m along a horizontal straightaway to a stop. If the child and sled together have a mass of 60.0 kg , what is the average retarding force on the sled on the horizontal straightaway?
52. (II) (a) A box sits at rest on a rough $33^{\circ}$ inclined plane. Draw the free-body diagram, showing all the forces acting on the box. (b) How would the diagram change if the box were sliding down the plane? (c) How would it change if the box were sliding up the plane after an initial shove?
53. (II) A wet bar of soap slides down a ramp 9.0 m long inclined at $8.0^{\circ}$. How long does it take to reach the bottom? Assume $\mu_{\mathrm{k}}=0.060$.
54. (II) A skateboarder, with an initial speed of $2.0 \mathrm{~m} / \mathrm{s}$, rolls virtually friction free down a straight incline of length 18 m in 3.3 s . At what angle $\theta$ is the incline oriented above the horizontal?
55. (II) Uphill escape ramps are sometimes provided to the side of steep downhill highways for trucks with overheated brakes. For a simple $11^{\circ}$ upward ramp, what minimum length would be needed for a runaway truck traveling $140 \mathrm{~km} / \mathrm{h}$ ? Note the large size of your calculated length. (If sand is used for the bed of the ramp, its length can be reduced by a factor of about 2.)
56. (II) A $25.0-\mathrm{kg}$ box is released on a $27^{\circ}$ incline and accelerates down the incline at $0.30 \mathrm{~m} / \mathrm{s}^{2}$. Find the friction force impeding its motion. What is the coefficient of kinetic friction?
57. (II) The block shown in Fig. 4-59 has mass $m=7.0 \mathrm{~kg}$

FIGURE 4-59 Block on inclined plane.
Problems 57 and 58.
58. (II) A block is given an initial speed of $4.5 \mathrm{~m} / \mathrm{s}$ up the $22.0^{\circ}$ plane shown in Fig. 4-59. (a) How far up the plane will it go? (b) How much time elapses before it returns to its starting point? Ignore friction.
59. (II) The crate shown in Fig. 4-60 lies on a plane tilted at an $y$ angle $\theta=25.0^{\circ}$ to the horizontal, with $\mu_{\mathrm{k}}=0.19$. (a) Determine the acceleration of the crate as it slides down the plane. (b) If the crate starts from rest 8.15 m up along the plane from its base, what will be the crate's speed when it reaches the bottom of the incline?

## FIGURE 4-60

Crate on inclined plane. Problems 59 and 60.
60. (II) A crate is given an initial speed of $3.0 \mathrm{~m} / \mathrm{s}$ up the $25.0^{\circ}$ plane shown in Fig. 4-60. (a) How far up the plane will it go? (b) How much time elapses before it returns to its starting point? Assume $\mu_{\mathrm{k}}=0.12$.
61. (II) A car can decelerate at $-3.80 \mathrm{~m} / \mathrm{s}^{2}$ without skidding when coming to rest on a level road. What would its deceleration be if the road is inclined at $9.3^{\circ}$ and the car moves uphill? Assume the same static friction coefficient.
62. (II) A skier moves down a $12^{\circ}$ slope at constant speed. What can you say about the coefficient of friction, $\mu_{\mathrm{k}}$ ? Assume the speed is low enough that air resistance can be ignored.
63. (II) The coefficient of kinetic friction for a $22-\mathrm{kg}$ bobsled on a track is 0.10 . What force is required to push it down along a $6.0^{\circ}$ incline and achieve a speed of $60 \mathrm{~km} / \mathrm{h}$ at the end of 75 m ?
64. (II) On an icy day, you worry about parking your car in your driveway, which has an incline of $12^{\circ}$. Your neighbor's driveway has an incline of $9.0^{\circ}$, and the driveway across the street is at $6.0^{\circ}$. The coefficient of static friction between tire rubber and ice is 0.15 . Which driveway(s) will be safe to park in?
65. (III) Two masses $m_{\mathrm{A}}=2.0 \mathrm{~kg}$ and $m_{\mathrm{B}}=5.0 \mathrm{~kg}$ are on inclines and are connected together by a string as shown in Fig. 4-61. The coefficient of kinetic friction between each mass and its incline is $\mu_{\mathrm{k}}=0.30$. If $m_{\mathrm{A}}$ moves up, and $m_{\mathrm{B}}$ moves down, determine their acceleration. [Ignore masses of the (frictionless) pulley and the cord.]

FIGURE 4-61 Problem 65.
66. (III) A child slides down a slide with a $34^{\circ}$ incline, and at the bottom her speed is precisely half what it would have been if the slide had been frictionless. Calculate the coefficient of kinetic friction between the slide and the child.
67. (III) (a) Suppose the coefficient of kinetic friction between $m_{\mathrm{A}}$ and the plane in Fig. $4-62$ is $\mu_{\mathrm{k}}=0.15$, and that $m_{\mathrm{A}}=m_{\mathrm{B}}=2.7 \mathrm{~kg}$. As $m_{\mathrm{B}}$ moves down, determine the magnitude of the acceleration of $m_{\mathrm{A}}$ and $m_{\mathrm{B}}$, given $\theta=34^{\circ}$.
(b) What smallest value of $\mu_{\mathrm{k}}$ will keep the system from accelerating? [Ignore masses of the (frictionless) pulley and the cord.]

## General Problems

68. A $2.0-\mathrm{kg}$ purse is dropped from the top of the Leaning Tower of Pisa and falls 55 m before reaching the ground with a speed of $27 \mathrm{~m} / \mathrm{s}$. What was the average force of air resistance?
69. A crane's trolley at point P in Fig. 4-63 moves for a few seconds to the right with constant acceleration, and the $870-\mathrm{kg}$ load hangs on a light cable at a $5.0^{\circ}$ angle to the vertical as shown. What is the acceleration of the trolley and load?

FIGURE 4-63
Problem 69.
70. A $75.0-\mathrm{kg}$ person stands on a scale in an elevator. What does the scale read (in N and in kg ) when (a) the elevator is at rest, (b) the elevator is climbing at a constant speed of $3.0 \mathrm{~m} / \mathrm{s},(c)$ the elevator is descending at $3.0 \mathrm{~m} / \mathrm{s},(d)$ the elevator is accelerating upward at $3.0 \mathrm{~m} / \mathrm{s}^{2},(e)$ the elevator is accelerating downward at $3.0 \mathrm{~m} / \mathrm{s}^{2}$ ?
71. A city planner is working on the redesign of a hilly portion of a city. An important consideration is how steep the roads can be so that even low-powered cars can get up the hills without slowing down. A particular small car, with a mass of 920 kg , can accelerate on a level road from rest to $21 \mathrm{~m} / \mathrm{s}(75 \mathrm{~km} / \mathrm{h})$ in 12.5 s . Using these data, calculate the maximum steepness of a hill.
72. If a bicyclist of mass 65 kg (including the bicycle) can coast down a $6.5^{\circ}$ hill at a steady speed of $6.0 \mathrm{~km} / \mathrm{h}$ because of air resistance, how much force must be applied to climb the hill at the same speed (and the same air resistance)?
73. Francesca dangles her watch from a thin piece of string while the jetliner she is in accelerates for takeoff, which takes about 16 s . Estimate the takeoff speed of the aircraft if the string makes an angle of $25^{\circ}$ with respect to the vertical, Fig. 4-64.

FIGURE 4-64
Problem 73.

74. Bob traverses a chasm by stringing a rope between a tree on one side of the chasm and a tree on the opposite side, 25 m away, Fig. 4-65. Assume the rope can provide a tension force of up to 29 kN before breaking, and use a "safety factor" of 10 (that is, the rope should only be required to undergo a tension force of 2.9 kN ). (a) If Bob's mass is 72.0 kg , determine the distance $x$ that the rope must sag at a point halfway across if it is to be within its recommended safety range. (b) If the rope sags by only onefourth the distance found in $(a)$, determine the tension force in the rope. Will the rope break?

FIGURE 4-65 Problem 74.
75. Piles of snow on slippery roofs can become dangerous projectiles as they melt. Consider a chunk of snow at the ridge of a roof with a slope of $34^{\circ}$. (a) What is the minimum value of the coefficient of static friction that will keep the snow from sliding down? (b) As the snow begins to melt, the coefficient of static friction decreases and the snow finally slips. Assuming that the distance from the chunk to the edge of the roof is 4.0 m and the coefficient of kinetic friction is 0.10 , calculate the speed of the snow chunk when it slides off the roof. (c) If the roof edge is 10.0 m above ground, estimate the speed of the snow when it hits the ground.
76. (a) What minimum force $F$ is needed to lift the piano (mass $M$ ) using the pulley apparatus shown in Fig. 4-66? (b) Determine the tension in each section of rope: $F_{\mathrm{T} 1}, F_{\mathrm{T} 2}, F_{\mathrm{T} 3}$, and $F_{\mathrm{T} 4}$. Assume pulleys are massless and frictionless, and that ropes are massless.

FIGURE 4-66 Problem 76.

77. In the design of a supermarket, there are to be several ramps connecting different parts of the store. Customers will have to push grocery carts up the ramps and it is desirable that this not be too difficult. The engineer has done a survey and found that almost no one complains if the force required is no more than 18 N . Ignoring friction, at what maximum angle $\theta$ should the ramps be built, assuming a full $25-\mathrm{kg}$ cart?
78. A jet aircraft is accelerating at $3.8 \mathrm{~m} / \mathrm{s}^{2}$ as it climbs at an angle of $18^{\circ}$ above the horizontal (Fig. 4-67). What is the total force that the cockpit seat exerts on the $75-\mathrm{kg}$ pilot?

FIGURE 4-67
Problem 78.

79. A $7180-\mathrm{kg}$ helicopter accelerates upward at $0.80 \mathrm{~m} / \mathrm{s}^{2}$ while lifting a $1080-\mathrm{kg}$ frame at a construction site, Fig. 4-68. (a) What is the lift force exerted by the air on the helicopter rotors? (b) What is the tension in the cable (ignore its mass) which connects the frame to the helicopter? (c) What force does the cable exert on the helicopter?

FIGURE 4-68
Problem 79.

80. An elevator in a tall building is allowed to reach a maximum speed of $3.5 \mathrm{~m} / \mathrm{s}$ going down. What must the tension be in the cable to stop this elevator over a distance of 2.6 m if the elevator has a mass of 1450 kg including occupants?
81. A fisherman in a boat is using a "10-lb test" fishing line. This means that the line can exert a force of 45 N without breaking ( $1 \mathrm{lb}=4.45 \mathrm{~N}$ ). (a) How heavy a fish can the fisherman land if he pulls the fish up vertically at constant speed? (b) If he accelerates the fish upward at $2.0 \mathrm{~m} / \mathrm{s}^{2}$, what maximum weight fish can he land? (c) Is it possible to land a $15-\mathrm{lb}$ trout on $10-\mathrm{lb}$ test line? Why or why not?
82. A "doomsday" asteroid with a mass of $1.0 \times 10^{10} \mathrm{~kg}$ is hurtling through space. Unless the asteroid's speed is changed by about $0.20 \mathrm{~cm} / \mathrm{s}$, it will collide with Earth and cause tremendous damage. Researchers suggest that a small "space tug" sent to the asteroid's surface could exert a gentle constant force of 2.5 N . For how long must this force act?
83. Three mountain climbers who are roped together in a line are ascending an icefield inclined at $31.0^{\circ}$ to the horizontal (Fig. 4-69). The last climber slips, pulling the second climber off his feet. The first climber is able to hold them both. If each climber has a mass of 75 kg , calculate the tension in each of the two sections of rope between the three climbers. Ignore friction between the ice and the fallen climbers.

FIGURE 4-69 Problem 83.
84. As shown in Fig. 4-70, five balls (masses 2.00, 2.05, 2.10, $2.15,2.20 \mathrm{~kg}$ ) hang from a crossbar. Each mass is supported by " $5-\mathrm{lb}$ test" fishing line which will break when its tension force exceeds 22.2 N ( $=5.00 \mathrm{lb}$ ). When this device is placed in an elevator, which accelerates upward, only the lines attached to the 2.05 and 2.00 kg masses do not break. Within what range is the elevator's acceleration?

85. Two rock climbers, Jim and Karen, use safety ropes of similar length. Karen's rope is more elastic, called a dynamic rope by climbers. Jim has a static rope, not recommended for safety purposes in pro climbing. (a) Karen (Fig. 4-71) falls freely about 2.0 m and then the rope stops her over a distance of 1.0 m . Estimate how large a force (assume constant) she will feel from the rope. (Express the result in multiples of her weight.) (b) In a similar fall, Jim's rope stretches by only 30 cm . How many times his weight will the rope pull on him? Which climber is more likely to be hurt?

## FIGURE 4-71

Problem 85.

86. A coffee cup on the horizontal dashboard of a car slides forward when the driver decelerates from $45 \mathrm{~km} / \mathrm{h}$ to rest in 3.5 s or less, but not if she decelerates in a longer time. What is the coefficient of static friction between the cup and the dash? Assume the road and the dashboard are level (horizontal).
87. A roller coaster reaches the top of the steepest hill with a speed of $6.0 \mathrm{~km} / \mathrm{h}$. It then descends the hill, which is at an average angle of $45^{\circ}$ and is 45.0 m long. What will its speed be when it reaches the bottom? Assume $\mu_{\mathrm{k}}=0.12$.
88. A motorcyclist is coasting with the engine off at a steady speed of $20.0 \mathrm{~m} / \mathrm{s}$ but enters a sandy stretch where the coefficient of kinetic friction is 0.70 . Will the cyclist emerge from the sandy stretch without having to start the engine if the sand lasts for 15 m ? If so, what will be the speed upon emerging?
89. The $70.0-\mathrm{kg}$ climber in Fig. $4-72$ is supported in the "chimney" by the friction forces exerted on his shoes and back. The static coefficients of friction between his shoes and the wall, and between his back and the wall, are 0.80 and 0.60 , respectively. What is the minimum normal force he must exert? Assume the walls are vertical and that the static friction forces are both at their maximum. Ignore his grip on the rope.

FIGURE 4-72
Problem 89.

90. A $28.0-\mathrm{kg}$ block is connected to an empty $2.00-\mathrm{kg}$ bucket by a cord running over a frictionless pulley (Fig. 4-73). The coefficient of static friction between the table and the block is 0.45 and the coefficient of kinetic friction between the table and the block is 0.32 . Sand is gradually added to the bucket until the system just begins to move.
(a) Calculate the mass of sand added to the bucket.
(b) Calculate the acceleration of the system. Ignore mass of cord.

91. A $72-\mathrm{kg}$ water skier is being accelerated by a ski boat on a flat ("glassy") lake. The coefficient of kinetic friction between the skier's skis and the water surface is $\mu_{\mathrm{k}}=0.25$ (Fig. 4-74). (a) What is the skier's acceleration if the rope pulling the skier behind the boat applies a horizontal tension force of magnitude $F_{\mathrm{T}}=240 \mathrm{~N}$ to the skier $\left(\theta=0^{\circ}\right)$ ? (b) What is the skier's horizontal acceleration if the rope pulling the skier exerts a force of $F_{\mathrm{T}}=240 \mathrm{~N}$ on the skier at an upward angle $\theta=12^{\circ}$ ? (c) Explain why the skier's acceleration in part $(b)$ is greater than that in part (a).

FIGURE 4-74 Problem 91.
92. A $75-\mathrm{kg}$ snowboarder has an initial velocity of $5.0 \mathrm{~m} / \mathrm{s}$ at the top of a $28^{\circ}$ incline (Fig. 4-75). After sliding down the $110-\mathrm{m}$-long incline (on which the coefficient of kinetic friction is $\mu_{\mathrm{k}}=0.18$ ), the snowboarder has attained a velocity $v$. The snowboarder then slides along a flat surface (on which $\mu_{\mathrm{k}}=0.15$ ) and comes to rest after a distance $x$. Use Newton's second law to find the snowboarder's acceleration while on the incline and while on the flat surface. Then use these accelerations to determine $x$.

FIGURE 4-75 Problem 92.
93. (a) If the horizontal acceleration produced briefly by an earthquake is $a$, and if an object is going to "hold its place" on the ground, show that the coefficient of static friction with the ground must be at least $\mu_{\mathrm{s}}=a / g$. (b) The famous Loma Prieta earthquake that stopped the 1989 World Series produced ground accelerations of up to $4.0 \mathrm{~m} / \mathrm{s}^{2}$ in the San Francisco Bay Area. Would a chair have started to slide on a floor with coefficient of static friction 0.25 ?
94. Two blocks made of different materials, connected by a thin cord, slide down a plane ramp inclined at an angle $\theta$ to the horizontal, Fig. 4-76 (block B is above block A). The masses of the blocks are $m_{\mathrm{A}}$ and $m_{\mathrm{B}}$, and the coefficients of friction are $\mu_{\mathrm{A}}$ and $\mu_{\mathrm{B}}$. If $m_{\mathrm{A}}=m_{\mathrm{B}}=5.0 \mathrm{~kg}$, and $\mu_{\mathrm{A}}=0.20$ and $\mu_{\mathrm{B}}=0.30$, determine
(a) the acceleration of the blocks and
(b) the tension in the cord, for an angle $\theta=32^{\circ}$.

FIGURE 4-76
Problem 94.
95. A car starts rolling down a 1 -in-4 hill (1-in-4 means that for each 4 m traveled along the sloping road, the elevation change is 1 m ). How fast is it going when it reaches the bottom after traveling 55 m ? (a) Ignore friction. (b) Assume an effective coefficient of friction equal to 0.10 .
96. A $65-\mathrm{kg}$ ice skater coasts with no effort for 75 m until she stops. If the coefficient of kinetic friction between her skates and the ice is $\mu_{\mathrm{k}}=0.10$, how fast was she moving at the start of her coast?
97. An $18-\mathrm{kg}$ child is riding in a child-restraint chair, securely fastened to the seat of a car (Fig. 4-77). Assume the car has speed $45 \mathrm{~km} / \mathrm{h}$ when it hits a tree and is brought to rest in 0.20 s . Assuming constant deceleration during the collision, estimate the net horizontal force $F$ that the straps of the restraint chair exert on the child to hold her in the chair.

Problem 97.

## Search and Learn

1. (a) Finding her car stuck in the mud, a bright graduate of a good physics course ties a strong rope to the back bumper of the car, and the other end to a boulder, as shown in Fig. 4-78a. She pushes at the midpoint of the rope with her maximum effort, which she estimates to be a force $F_{\mathrm{P}} \approx 300 \mathrm{~N}$. The car just begins to budge with the rope at an angle $\theta$, which she estimates to be $5^{\circ}$. With what force is the rope pulling on the car? Neglect the mass of the rope. (b) What is the "mechanical advantage" of this technique [Section 4-7]? (c) At what angle $\theta$ would this technique become counterproductive? [Hint: Consider the forces on a small segment of rope where $\overrightarrow{\mathbf{F}}_{\mathrm{P}}$ acts, Fig. 4-78b.]
(a)

(b)

FIGURE 4-78 (a) Getting a car out of the mud, showing the forces on the boulder, on the car, and exerted by the person. (b) The free-body diagram: forces on a small segment of rope.
2. (a) Show that the minimum stopping distance for an automobile traveling on a level road at speed $v$ is equal to $v^{2} /\left(2 \mu_{\mathrm{s}} g\right)$, where $\mu_{\mathrm{S}}$ is the coefficient of static friction between the tires and the road, and $g$ is the acceleration of gravity. (b) What is this distance for a $1200-\mathrm{kg}$ car traveling $95 \mathrm{~km} / \mathrm{h}$ if $\mu_{\mathrm{s}}=0.65$ ? (c) What would it be if the car were on the Moon (the acceleration of gravity on the Moon is about $g / 6)$ but all else stayed the same?
3. In the equation for static friction in Section 4-8, what is the significance of the $<$ sign? When should you use the equals sign in the static friction equation?
4. Referring to Example 4-21, show that if a skier moves at constant speed straight down a slope of angle $\theta$, then the coefficient of kinetic friction between skis and snow is $\mu_{\mathrm{k}}=\tan \theta$.

## ANSWERSTO EXERCISES

A: No force is needed. The car accelerates out from under the cup, which tends to remain at rest. Think of Newton's first law (see Example 4-1).
B: (a).
C: (i) The same; (ii) the tennis ball; (iii) Newton's third law for part (i), second law for part (ii).

D: (b).
E: (b).
F: (b).
G: (c).
H: Yes; no.

[^0]:    ${ }^{\dagger}$ We treat everyday objects in motion here. When velocities are extremely high, close to the speed of light $\left(3.0 \times 10^{8} \mathrm{~m} / \mathrm{s}\right)$, we use the theory of relativity (Chapter 26), and in the submicroscopic world of atoms and molecules we use quantum theory (Chapter 27 ff ).

[^1]:    ${ }^{\dagger}$ A review of proportionality is given in Appendix A .

[^2]:    ${ }^{\dagger}$ Be careful not to confuse $g$ for gram with $g$ for the acceleration due to gravity. The latter is always italicized (or boldface when shown as a vector).

[^3]:    "The concept of "vertical" is tied to gravity. The best definition of vertical is that it is the direction in which objects fall. A surface that is "horizontal," on the other hand, is a surface on which a round object won't start rolling: gravity has no effect. Horizontal is perpendicular to vertical.
    *Since $1 \mathrm{~N}=1 \mathrm{~kg} \cdot \mathrm{~m} / \mathrm{s}^{2}$ (Section 4-4), then $1 \mathrm{~m} / \mathrm{s}^{2}=1 \mathrm{~N} / \mathrm{kg}$.

[^4]:    ${ }^{\dagger}$ Values are approximate and intended only as a guide.

[^5]:    ${ }^{\dagger}$ We used values rounded off to 2 significant figures to obtain $a=4.0 \mathrm{~m} / \mathrm{s}^{2}$. If we kept all the extra digits in our calculator, we would find $a=0.4134 g \approx 4.1 \mathrm{~m} / \mathrm{s}^{2}$. This difference is within the expected precision (number of significant figures, Section 1-4).
